Abstract

The purpose of this study is to review the existing research on the definition, conceptualization and measurement of market orientation and to provide guidance on the direction of future research in this area. Even though the number of research studies on market orientation has increased substantially, there is still no agreement among scholars regarding how to define market orientation, how broad its scope is, and how to measure it. Although the number of market orientation measurement scales has increased over the years, there is still limited research on how to differentiate between the various measures of market orientation. It is hoped that this review will provide researchers a deeper understanding of the scope of market orientation, help them select a suitable market orientation scale for their studies, and guide them in a more productive research path on the definition and measurement of market orientation.

Keywords: conceptualization, literature review, market orientation, measurement scale

1. Introduction

As the importance of market orientation is acknowledged by growing numbers of academicians and practitioners, increasing research efforts have been directed to measurement issues pertaining to market orientation. A number of marketing scholars have devoted their attention to identifying the major domains of the market orientation construct and developing more reliable and valid measures of it (e.g., Atuahene-Gima, 1995; Deng & Dart, 1994; Deshpandé & Farley, 1996; Dong, Zhang, Hinsch, & Zou, 2016; Gyepi-Garbrah & Asamoah, 2015; Homburg & Pflesser, 2000; Jaworski & Kohli, 1993; Jangl, 2016; Kohli, Jaworski, & Kumar, 1993; Matsuno & Mentzer, 2000; Matsuno, Mentzer, & Rentz, 2005; Modi, 2012; Modi & Mishra 2010; Narver & Slater, 1990). In spite of the growing number of research studies on market orientation, there is still no consensus among researchers about the definition of market orientation and how to measure it (Matsuno et al., 2005). Even though the number of the market orientation scales has increased over the years, there is little research on how to differentiate between the various scales of market orientation. This study aims to review the extant research on the definition, conceptualization and measurement of market orientation and to provide a roadmap on the direction of future research in this area. It is hoped that this review will help researchers better understand the scope of market orientation, choose an appropriate market orientation scale for their studies, and follow a more productive path for future research on the definition and measurement of market orientation.

2. Definition and Conceptualization of Market Orientation

A significant volume of conceptual research on market orientation has discussed such descriptive issues as how to install a strong market orientation or market-oriented thought and behavior within an organization (e.g., Day, 1990, 1994, 1998; Hunt & Morgan, 1995; Jaworski & Kohli, 1993; Ruekert, 1992). A number of scholars have offered different definitions and conceptualizations of market orientation (e.g., Deshpandé, Farley, & Webster, 1993; Kohli & Jaworski, 1990; Narver & Slater, 1990). Throughout the literature a variety of terms have been used interchangeably to address a market orientation. The terms market-oriented, market-driven (Day, 1994; Deshpandé et al., 1993), customer orientation (Deshpandé & Farley, 1998, 1999; Shapiro, 1988; Webster, 1988), customer focus (Deshpandé & Farley, 1998, 1999), customer-focused, customer-oriented, and customer-centric are often used synonymously. “Close to the customer” has been a key term to express a market orientation...
(Caruana, Ramaseshan, & Ewing, 1998; Peters & Waterman, 1982; Shapiro, 1988; Webster, 1988). Narver and Slater (1990) and Kohli and Jaworski (1990) have chosen to use the term “market orientation” over the terms “the marketing concept” or “marketing orientation” in their articles.

Many scholars have presented their views on which term is more appropriate to use to address a market orientation. Sargeant and Mohamad (1999) argued that the term market orientation seems to be more appropriate since it is “less politically charged and does not inflate the importance of the marketing function in the organization” (Sargeant & Mohamad, 1999, p.44). The term market orientation implies that marketing is the responsibility of the all functional units in the organization, not just the marketing function (Sargeant & Mohamad, 1999). According to Slater and Narver (1994b, 1998), market orientation and marketing orientation are entirely different concepts. To the authors, a marketing orientation refers to “an emphasis on the marketing function” (p.24). Caruana et al. (1998) believed that a marketing orientation refers to the specific activities of the marketing department or division. Under a marketing orientation, the marketing function gains importance and is placed at the top of a hierarchical structure in the organization. Traditional marketing activities gain importance even though they are not major or appropriate core capabilities of the firm. Such an overemphasis on and empowerment of one functional area in the organization automatically leads to interdepartmental conflicts over issues like resource allocation and business priorities (Slater & Narver, 1994b). Therefore, using a marketing orientation as synonymous with a market orientation is misleading, given the fact that “Customer value is created by core capabilities throughout the entire organization” (Slater & Narver, 1994b, p.24). The scope of a market orientation is broader than that of a marketing orientation.

According to Deshpandé and Webster (1989), Shapiro (1988), and Slater and Narver (1995), the terms ‘market-oriented’, ‘market driven’, and ‘customer focused’ are synonymous. Day (1998) stated that “a strong market orientation is embedded deeply in the genetic make-up of a market-driven organization” (p.8). Day (1994) argued that “organizations can become more market oriented by identifying and building the special capabilities that set market-driven organizations apart” (p.38). Furthermore, according to Day (1998, p.8), there are seven distinctive behavior and capabilities of a market-driven organization: (1) offering superior solutions and experiences, (2) focusing on superior customer value, (3) converting satisfaction to loyalty, (4) energizing and retaining employees, (5) anticipating competitors’ moves, (6) viewing marketing as an investment, not a cost, and (7) nurturing and leveraging brands as assets. These behaviors and capabilities are also associated with a market orientation. Day (1994, 1998) used the term “market-driven” to define an organization with a strong market orientation. Based on the arguments offered by Day (1994, 1998), being market-driven can be considered either the same as a market orientation or a crucial component of a market orientation. In either case, it is appropriate to say that the arguments made related to market-driven organizations apply largely to market-oriented organizations as well.

On the other hand, Jaworski and Kohli (1996) argued that the terms market-oriented, market-driven, and customer-oriented do not share the same meaning, and are not synonymous. The term market orientation focuses on a larger set of market forces and stakeholders, not only customers. Whereas, the term customer orientation emphasizes a focus on customers. In a commentary of Christensen and Bower’s (1996) study, Slater and Narver (1998) underscored the distinctions between the two types of customer orientation. These are a customer-led philosophy and a market-oriented philosophy. These are often confused with each other. A customer-led business is likely to be reactive, have a short-term focus, emphasizes customers’ expressed wants/needs, and customer satisfaction (Slater & Narver, 1998). On the other hand, a market-oriented business is prone to act proactively, to adopt a long-term orientation, to understand and satisfy customers’ both expressed and latent wants/needs, and to emphasize customer value (Slater & Narver, 1998).

A comprehensive examination of the current literature on market orientation reveals that there has been no consensus among scholars on the definition of market orientation. Marketing scholars have not reached a complete agreement on what constitutes to a market orientation. The debate on this issue is ongoing (Cadogan, Diamantopoulos, & Mortanges, 1999; Caruana et al., 1998; Matsuno et al., 2005). According to Siguaw, Simpson, and Baker (1998), for the most part, different definitions of market orientation have mainly been developed from different conceptualizations of the marketing concept. Therefore, it is possible that the variations in the definitions of a market orientation can be reflective of the diverse perspectives that have been adopted over time to define the marketing concept (Siguaw et al., 1998).

A market orientation has been seen as the implementation of the marketing concept (e.g., Kohli & Jaworski, 1990), that is considered as a business philosophy, an ideal or a policy statement (Barksdale & Darden, 1971; Kohli & Jaworski, 1990; McNamara, 1972). More comprehensive, informative definitions of market orientation were suggested by Kohli and Jaworski (1990), and Narver and Slater (1990). These definitions have been
widely-accepted and frequently-cited by marketing scholars throughout the literature. Kohli and Jaworski (1990) offered a formal operational definition of a market orientation as follows: “Market orientation is the organization-wide generation of market intelligence pertaining to current and future customer needs, dissemination of the intelligence across departments, and organization-wide responsiveness to it” (p.6). Kohli and Jaworski (1990) attempted to delineate the domain of the market orientation construct through a comprehensive model. Their definition of the market orientation concept is based on a field research conducted through in-depth interviews with 62 managers in four U.S. cities. The results indicated that, without exception, the managers interviewed agreed that a customer focus is the central element of a market orientation. For many practitioners, a customer orientation did not mean just the collection of customer information concerning their needs and preferences through customer research. Indeed, it meant the gathering of market intelligence that is based on information about exogenous factors affecting customer wants and needs, and information about current and future needs of customers (Kohli & Jaworski, 1990). This is an indication of the fact that practitioners have a long-term-oriented view on market orientation. Moreover, market orientation is not seen solely as a responsibility of the marketing department. Interestingly, the idea that profitability is a component of market orientation is not supported by the field findings. Rather, all viewed profitability as a consequence of a market orientation, not as a part of it (Kohli & Jaworski, 1990). Narver and Slater (1990) viewed market orientation as follows: “the organization culture that most effectively and efficiently creates the necessary behaviors for the creation of superior value for buyers and, thus, superior performance for the business” (p.21). Narver and Slater (1990) suggested customer orientation, competitor focus, and cross-functional coordination as the three pillars of market orientation. These pillars were characterized as being long-term in vision and profit-driven (Narver & Slater, 1990). Deshpandé et al., (1993) saw customer orientation as synonymous with a market orientation since they accepted a traditional definition of a market, that is, “the set of all potential customers of a firm” (p.27). They defined customer orientation as “the set of beliefs that puts the customer’s interest first, while not excluding those of all other stakeholders such as owners, managers, and employees, in order to develop a long-term profitable enterprise” (p.27; Also see Jaworski & Kohli, 1996, p.120). This view of a market orientation (or customer orientation) is consistent with the three components of a market orientation suggested by Narver and Slater (1990) with the exception of a competitor orientation. In other words, Deshpandé et al.’s (1993) definition of a market orientation reflects both the contents of customer orientation and interfunctional coordination defined by Narver and Slater (1990). Deshpandé and Farley (1996) defined market orientation according to the content of their parsimonious 9-item market orientation scale developed from the three existing scales through a comprehensive meta-analysis procedure. They briefly defined market orientation as: “the set of cross-functional processes and activities directed at creating and satisfying customers through continuous needs-assessment” (p.14; Also see Deshpandé & Farley, 1998, p.213; Deshpandé & Farley, 1999, p.112).

According to Kohli and Jaworski (1990), a market-oriented organization is one whose actions are consistent with the marketing concept. In other words, a market-oriented or market-driven organization is the one in which the three pillars of the marketing concept (customer focus, coordinated marketing, and profitability) are successfully implemented (Kohli & Jaworski, 1990). However, Hunt and Morgan (1995) argued that market orientation “is not the same thing as, nor a different form of, nor the implementation of, the marketing concept. Rather, it would seem that a market orientation should be conceptualized as supplementary to the marketing concept” (p.34). They proposed that: “a market orientation is (1) the systematic gathering of information on customers and competitors, (2) the systematic analysis of the information for the purpose of developing market knowledge, and (3) the systematic use of such knowledge to guide strategy recognition, understanding, creation, selection, implementation, and modification.” (Hunt & Morgan, 1995, p.1; Wrenn, 1997, p.34). Finally, Day (1994) viewed market orientation as a set of excellent skills by stating that “market orientation represents superior skills in understanding and satisfying customers” (p.37; Day, 1990; Also see Jaworski & Kohli, 1996, p.120). Table 1 presents five different definitions of market orientation offered by scholars and the comparisons of these definitions.

(2) Narver and Slater (1990)  

Market orientation is “the organization culture that most effectively and efficiently creates the necessary behaviors for the creation of superior value for buyers and, thus, superior performance for the business” (p.21).

(3) Deshpandé et al. (1993)  

Customer orientation (or market orientation) is “the set of beliefs that puts the customer’s interest first, while not excluding those of all other stakeholders such as owners, managers, and employees, in order to develop a long-term profitable enterprise” (p.27).

(4) Day (1994)  

Market orientation is a set of excellent skills by stating that “market orientation represents superior skills in understanding and satisfying customers” (p.37).

(5) Deshpandé and Farley (1996)  

Market orientation is “the set of cross-functional processes and activities directed at creating and satisfying customers through continuous needs-assessment” (p.14).

Comparison of Market Orientation Definitions (1), (2), and (3) by Day (1994, p.37)

Each definition represents principal features of a market orientation and complements each other:

1) A set of beliefs that puts the customer’s interests first (Deshpandé, Farley, and Webster 1993).

2) The ability of the organization to generate, disseminate, and use superior information about customers and competitors (Kohli and Jaworski 1990).

3) The coordinated application of interfunctional resources to the creation of superior customer value (Narver and Slater 1990).

Comparison of Market Orientation Definitions (1), (2), (3), and (4) by Jaworski and Kohli (1996, p.121)

Similarities:

1) All maintain an external focus.

2) In all definitions, the central focus is the customer.

3) All definitions suggest a broader focus that include not only customers but also some other influential forces, such as competitors, technology, regulation, and other stakeholders.

4) All definitions accept the importance of being responsive to customer needs and wants.

Differences:

1) Each definition is based on one of the two alternative perspectives on market orientation: (a) a behavioral/activities/process perspective (Day, 1994; Kohli & Jaworski, 1990), versus (b) a cultural perspective (Deshpandé et al., 1993; Narver & Slater, 1990).

2) The terms market-oriented, market-driven, and customer-oriented do not share the same meaning.

2.1 Comparisons of Definitions and Conceptualizations of Market Orientation

Some scholars have tried to identify the similarities and differences among these definitions (e.g., Day, 1994; Jaworski & Kohli, 1996). Table 1 presents the comparisons of five definitions of market orientation made by scholars. According to Day (1994), the different definitions of market orientation suggested by Deshpandé et al. (1993), Kohli and Jaworski (1990), and Narver and Slater (1990) are not alternative to each other rather they complement each other. He believed that each of the four definitions of market orientation represents principal features of a market orientation (p.37, in smaller fonts): (1) a set of beliefs that puts the customer’s interests first (Deshpandé et al., 1993), (2) the ability of the organization to generate, disseminate, and use superior information about customers and competitors (Kohli & Jaworski, 1990), and (3) the coordinated application of interfunctional resources to the creation of superior customer value (Narver & Slater, 1990). Similarly, Jaworski and Kohli (1996) analyzed the four different definitions of a market orientation, suggested by Day (1994), Deshpandé et al. (1993), Kohli and Jaworski (1990), and Narver and Slater (1990), and determined the similarities and differences among these definitions. They identified four similarities among the four well-known
definitions (p.121): First, all maintain an external focus. Second, in all definitions, the central focus is the customer. Third, all definitions suggest a broader focus that include not only customers but also some other influential forces, such as competitors, technology, regulation, and other stakeholders. Fourth, all definitions accept the importance of being responsive to customer needs and wants. They recognized two differences among the definitions (p.121). First, each definition is based on one of the two alternative perspectives: (1) a *behavioral/activities/process* perspective versus (2) a *cultural* perspective. Day (1994), and Kohli and Jaworski (1990) adopted the former perspective while Deshpandé et al. (1993), and Narver and Slater (1990) followed the latter in their definitions. Second, Jaworski and Kohli (1996) believed that the terms market-oriented, market-driven, and customer-oriented do not share the same meaning. The term market orientation concentrates on a larger set of market forces and stakeholders, not only customers, while the term customer orientation emphasizes only customers.

### 2.2 Arguments on Broadening the Scope of Market Orientation

In the market-driven era, the market has the “pivotal role” in the design, development, and implementation of new organizational strategies and in the discard of the old ones (Cravens, 1998, p.237; Cravens, Greenley, Piercy, & Slater, 1998; Day, 1994). Developing effective new market strategies can create great opportunities for businesses. Designing market strategies on the basis of a reactive stance and/or a proactive stance can significantly affect the success of businesses (Baker & Sinkula, 1999; Chandy & Tellis, 1998; Narver, Slater, & MacLachlan, 2004). Some studies have stressed the importance of a proactive stance for businesses and the need to broaden the scope of market orientation to include proactive responsiveness or market insight or the *driving markets* concept as an integral part of it (e.g., Chandy & Tellis, 1998; Jaworski & Kohli, 1996; Jaworski, Kohli, & Sahay, 2000; Narver et al., 2004).

Several scholars have contended that the scope of a market orientation is actually broader than that previously defined (e.g., Jaworski & Kohli, 1996; Jaworski et al., 2000). Jaworski et al. (2000) criticized the literature for defining a market orientation as an approach that mainly focuses on existing or current customer needs/preferences and market structure (customer-led). They believe that this would be a narrow conceptualization of a market orientation. Indeed, a market orientation is more than that and aims to proactively shape the customer preferences and/or the market structure rather than accepting them as given. *Market/industry foresight or proactiveness* has been viewed as an extremely crucial, subset element of being market-oriented by Jaworski and Kohli (1996). Jaworski and Kohli (1996, p.126) defined market foresight as “a strategic orientation to market that moves beyond the short-term current customers and competitors to the broader forces that shape markets.” In another definition, industry foresight has been referred to “an organization’s ability to anticipate and perhaps even shape the evolution of markets” (Also see Hamel & Prahalad, 1994; Jaworski & Kohli, 1996, p.125). Obviously, market or industry foresight broadens the concept of market orientation. Thus, a market orientation is characterized by not only a reactive position but also a proactive position towards markets.

### 3. Measures of Market Orientation

Some earlier studies highlighted various measurement concerns of scholars (See Lawton & Parasuraman, 1980; McNamara, 1972) regarding the marketing concept or a market orientation. However, most of the time, the primary focus of these studies was not to develop a measurement scale. Therefore, the measures they utilized were not developed on the basis of systematical procedures for scale development (Kohli et al., 1993). Rather, the earlier studies on the adoption of the marketing concept often relied on very simple measures (Deng & Dart, 1994).

### 3.1 Review of Major Market Orientation Scales

The utilization of a multi-item measure of market orientation is quite new in the literature. Kotler (1977) can be regarded as the one of the earliest scholars that attempted to define the domain of market orientation and to measure it. Kotler (1977) developed a marketing effectiveness audit or scale that can be used by managers in assessing how well their organization understands and implements marketing. He used a questionnaire or audit to measure the level of marketing effectiveness. He measured marketing effectiveness through five dimensions: *Consumer philosophy*, *integrated marketing organization*, *adequate marketing information*, *strategic orientation*, and *operational efficiency*. These dimensions are closely linked to the dimensions of market orientation such as customer orientation, competitor orientation, cross-functional coordination (Narver & Slater, 1990), and market intelligence generation (Kohli & Jaworski, 1990). Even though the domains of the two concepts, marketing effectiveness and market orientation, may not overlap perfectly in every aspect, they are definitely closely related to one another. According to Au and Tse (1995) and Tse (1998), the major pitfall of the questionnaire used by Kotler (1977) was the wording of the questions. Since the questionnaire was intended to be used for
self-evaluation, the questions were asked in a direct manner rather than in an indirect manner. As a result, it was possible that respondents were more likely to give socially desirable responses rather than true responses in a large scale survey (Au & Tse, 1995; Tse, 1998). In spite of its apparent limitation, the marketing effectiveness audit can be considered as one of the first steps toward developing multi-dimensional, more reliable measures of market orientation.

To the authors’ best knowledge, the earliest, reliable, comprehensive, multi-item measures of market orientation were developed by Narver and Slater (1990) and Jaworski and Kohli (1993). These scholars have also developed clear and precise definitions of the domain of the market orientation construct. Both Jaworski and Kohli (1993) and Narver and Slater (1990) developed these scales as parts of their empirical studies focusing on the market orientation-organizational performance relationship. These two scales are widely-recognized by scholars and frequently-used in empirical studies pertaining to market orientation.

Narver and Slater (1990) conceptualized a market orientation and developed a valid, reliable measure of market orientation which is labeled as MKTOR. MKTOR is a scale that measures the level of market orientation. Market orientation was conceptualized as having three behavioral components (customer orientation, competitor orientation and interfunctional coordination) and two decision criteria (long-term focus and profitability). In order to develop a measure of market orientation and test the proposed model, 440 respondents in 140 forest product divisions or strategic business units (SBUs) of a major Western corporation were surveyed. They found evidence of the construct validity for the three-component model of a market orientation. These components were customer orientation, competitor orientation, and interfunctional coordination. Long-term focus and profitability were simply disregarded.

Kohli, Jaworski, and Kumar (1993) believe that the scale proposed by Narver and Slater (1990) is closely associated with Day and Wensley’s (1988) conceptualization which is based on competitor-orientedness, customer-orientedness, and inter-functional coordination. Narver and Slater’s (1990) conceptualization of market orientation closely parallels to Kohli and Jaworski’s (1990) conceptualization. Three behavioral components (i.e., customer orientation, competitor orientation, and interfunctional coordination) suggested by Narver and Slater (1990) involve intelligence generation, dissemination, and managerial action. This scale has certain advantages. First, the scale was developed at the SBU level, not at the corporate level. This feature of MKTOR makes this scale more operational and also largely applicable to both a single organization and an organization with multiple SBUs. A small group of scholars have argued that market orientation should be evaluated at the SBU level since the levels of market orientation within separate SBUs of the same corporation can vary significantly (e.g., Kohli & Jaworski, 1990; Ruekert, 1992). Furthermore, Workman, Homburg, & Gruner (1998, p.26) suggested that marketing processes/activities are mostly performed at the SBU/divisional level. Second, MKTOR can serve as a good diagnostic tool in organizations in measuring the level of a market orientation. However, MKTOR has two limitations. First, MKTOR was based on the data obtained from many SBUs of a single corporation in a specific business area (i.e., forest products divisions). This characteristic of the sample may restrict the generalizability of this scale. Second, even though this scale is based on a cultural perspective of market orientation, its content is more reflective of behavioral aspects of a market-oriented culture. Homburg and Pflesser (2000) noted that the earlier studies that adopted a cultural perspective of market orientation have generally utilized behavioral measures to assess market orientation. These studies have given little consideration to foundational, underlying elements of a market-oriented culture (Homburg & Pflesser, 2000). This observation also seems to be true for the MKTOR scale. MKTOR has been used in the development of some other market orientation scales (e.g., Cadogan et al., 1999; Deng & Dart, 1994; Deshpandé & Farley, 1996; Gray, Matear, Boshoff, & Matheson, 1998). It has also been used by a large number of studies as a measurement instrument (e.g., Deshpandé & Farley, 1999; Greenley, 1995; Han, Kim, & Srivastava, 1998; Maignan, Ferrell, & Hult, 1999; Menguc, 1996; Sigauw, Brown, & Widing, 1994; Slater & Narver, 1994a).

Jaworski and Kohli (1993) empirically tested and validated a theoretical framework of a market orientation which they suggested in their 1990 study. The primary objective of this study was to investigate the antecedents and consequences of a market orientation. They utilized a complex sampling method involving two separate samples. The first sample was drawn from the member companies of the Marketing Science Institute (MSI) and the top 1000 companies (in sales revenues) included in the Dun and Bradstreet Million Dollar Directory. In order to cross-validate the findings from the first sample, data were obtained from a second sample. They used the American Marketing Association membership roster as the sampling frame for the second sample. As a result, the authors developed a 32-item and four-dimension market orientation scale with good reliability scores.

Jaworski and Kohli (1993) with this study developed a clear definition of a market orientation, identified the domain of the market orientation construct, and designed a widely-used measurement scale of a market
orientation. This measure of market orientation is based on the behavioral perspective of market orientation. It is the origin of the MARKOR scale. This scale has been utilized in the construction of a number of market orientation scales (e.g., Cadogan et al., 1999; Deshpandé & Farley, 1996; Gray et al., 1998; Kohli et al., 1993; Matsuno & Mentzer, 2000). Based on the high value of the coefficient alpha for each dimension, this scale can be regarded as a reliable instrument to evaluate the level of market orientation. The inclusion of diverse businesses in the sample and the use of a multiple-informant (marketing executive versus nonmarketing executive) approach in data collection are some of the positive properties of this study that add value to the associated scale. Additionally, the comprehensive nature of the sampling procedure used in this study contributes to the overall reliability of the scale. This scale allows the measurement of market orientation at the business unit level. In this regard, it is as appropriate as the MKTOR scale. However, this scale is longer than the MKTOR scale. The length of this scale may be somewhat cumbersome for researchers and even for practitioners. Given the observation that the current trend in research is apparently towards developing more parsimonious measures of market orientation, the length of the scale might make it less favorable among researchers despite its advantages.

Kohli and Jaworski (1990), Jaworski and Kohli (1993), and Kohli et al. (1993) defined a market orientation, as mentioned earlier, as the organization-wide generation of market intelligence pertinent to current and future needs/preferences of customers, dissemination of this intelligence across the various departments vertically and horizontally in the organization, and organizational responsiveness to this intelligence. Kohli et al. (1993) aimed to develop a valid and reliable measure of market orientation. Based on the four domains of market orientation suggested by Kohli and Jaworski (1990), and Jaworski and Kohli (1993), the authors proposed a 20-item market orientation scale and assessed the psychometric properties of this measure. This market orientation scale was labeled as MARKOR. The distinguishing feature of their study is the implementation of a strict systematic procedure for the scale development. This measure possesses some important characteristics (Kohli et al., 1993). First, it has a focus on all market forces including customers and the forces that drive customer needs and preferences and competitive actions. Second, it includes activity-based items rather than business philosophy. Third, it is a combination of a general market orientation factors and related component factors. Finally, MARKOR has managerial significance since the suggested scale is assessed and developed at the SBU level. It enables an organization to assess their progress toward market orientedness at a SBU level and for all of its SBUs. It helps an organization accomplish target market orientation levels which are feasible for the organization (Kohli et al., 1993) and identify problem areas in each component of market orientation. According to Kohli et al. (1993), the proposed measurement scale is closely associated with Dickson's (1992) view of competitive rationality. This study can be viewed as a comprehensive extension of the scale work done by Kohli and Jaworski (1993). The MARKOR scale was used by Homburg and Pflesser (2000), Matsuno and Mentzer (2000), and Siguaw, Simpson, and Baker (1998, 1999).

Some other researchers have also attempted to develop market orientation scales. But, these scales are relatively less known (e.g., Cadogan et al., 1999; Deng & Dart, 1994; Deshpandé & Farley, 1996; Gray et al., 1998; Gyepi-Garbrah & Asamoah, 2015; Lado, Maydeu-Olivares, & Rivera, 1998; Matsuno & Mentzer, 2000; Matsuno et al., 2005; Ruekert, 1992). Most of the market orientation scales developed over the last two decades (e.g., Cadogan et al., 1999; Deng & Dart, 1994; Deshpandé & Farley, 1996; Matsuno & Mentzer, 2000) have been based on or originated from the two widely used scales discussed above (MKTOR and MARKOR). More recently, Gyepi-Garbrah and Asamoah (2015) proposed a holistic measurement scale of internal market orientation (IMO) which consists of the following three dimensions: Responsiveness to information, dissemination of information, and internal information generation. Their study was conceptual and the scale was not tested.

Table 2 provides a brief review of main studies pertinent to measurement issues on market orientation

Narver and Slater (1990) To explore the relationship between market orientation and business profitability. 440 respondents in 140 forest product divisions or SBUs of a major Western corporation. Response rate: 84%.

Customer Orientation, Competitor Orientation, Interfunctional Coordination, and Two Decision Criteria (Long-term Focus and Profitability).

MKTOR 15-item scale, 7-place response format.

Overall Reliability : .88

Customer Orientation (.8547, .8675)

Competitor Orientation (.7164,.7271)

Interfunctional Coordination (.7112,.7348)

Used by many studies in developing a new scale (e.g., Cadogan et al., 1999; Deng & Dart, 1994; Deshpandé & Farley, 1996; Gray et al., 1998) or testing a model (e.g., Deshpandé & Farley, 1999; Han et al., 1998; Maignan et al., 1999; Mengue, 1996; Siguaw et al., 1994; Slater & Narver, 1994a).

Ruekert (1992) To examine the level of variation in market orientation among SBUs of the same corporation and the effect of market orientation on the corporation’s processes and systems, employees’ job attitudes, and firm performance. 5016 respondents from 5 SBUs of a large, Fortune 500, high technology company based in the U.S. Overall response rate: 70%

Sample I: 400 responses.

Sample II: 400 responses.

Managerial/Operational Level.

A 23-item market orientation scale.

Overall Reliability: .89

The Use of Customer Information (.81)

The Development of a Market Oriented Strategy (.72)

The Implementation of a Market Oriented Strategy (.81).

This scale was used by Atuahene-Gima (1995).

Response rate: 88.9% for marketing, 77.8% for nonmarketing and 229 SBUs.

Response rate: 79.6% for marketing, 70% for nonmarketing.

Sample II: 487 respondents.

Response rate: 47.2%

Multiple respondents.

Managerial Level (executives).

Intelligence Generation, Intelligence Dissemination, Response Design, and Response Implementation.

A 32-item, 5-point market orientation scale.

Intelligence Generation (.71)

Intelligence Dissemination (.82)

Response Design (.78)

Response Implementation(.82)

This scale has been utilized in the construction of a number of market orientation scales (e.g., Cadogan et al., 1999; Deshpandé & Farley, 1996; Gray et al., 1998; Kohli et al., 1993; Matsuno & Mentzer, 2000).

Customer Satisfaction Orientation (.95)
Competitive Orientation (.94).

Deshpandé and Farley (1996) To synthesize the three existing market orientation scales to develop a more parsimonious and predictive measurement scale. A conveniently-derived multinational sample of 82 marketing executives from 27 firms that are members of the MSI was used. Average three respondents from each SBU.

Gray et al. (1998) To extend the research done by Jaworski and Kohli (1993), Narver and Slater (1990), and Slater and Narver (1994a) by developing a managerially practical and parsimonious market orientation scale. A sample of 1099 senior executives from multiple industries in New Zealand. Response rate: 45%.
Senior Manager Level.

Lado et al. (1998) To propose a precise, theory-based definition of market orientation, to develop a market orientation scale that is based on this definition and to validate this scale in a two-country context. Preliminary Work: 4 marketing professors and 6 insurance sector managers in Belgium.
2 professors and 6 insurance experts in Spain.

Samples: 76 private Belgian insurance companies.
Response rate: 34/76.
104 private Spanish insurance companies.
Response rate: 32/104.

Non-marketing manager (54%).
Oczkowski and Farrell (1998) To develop a methodology that discriminates between alternative measures of market orientation.

Sample I: 861 publicly-traded companies from the D&B.
Response rate: 29.2%.

Sample II: 1164 privately-owned companies from the D&B in Australia.
Response rate: 17.1%.
Corporate/Top Management Level (CEO/General Manager).

MKTOR outperforms MARKOR:
MKTOR is more superior in explaining variations in measures of performance.
MKTOR with the Cronbach’s alphas of .921 and .905 has a greater reliability than MARKOR with the Cronbach’s alphas of .868 and .884.

Cadogan et al. (1999) To develop and validate a measure of export market orientation.

Sample I: 1327 UK exporters.
Response rate: 15%.

Sample II: 231 Dutch exporters
Response rate: 46%.

Export Intelligence Generation, Export Intelligence Dissemination, Export Intelligence Responsiveness (Behavioral Components), and Coordinating Mechanisms (an Integrative Component).

Export Market Orientation. Based on the integration of the conceptualizations of market orientation suggested by Narver and Slater (1990), and Kohli and Jaworski (1990).

Some of the measurement items were based on the scales developed by Jaworski and Kohli (1993), and Narver, Jacobson, and Slater (1993).

300 marketing executives of manufacturing companies in the U.S.

A 22-item market orientation scale.
Overall Reliability: .84.

Intelligence Generation (IG) (.66)
Intelligence Dissemination (ID) (.78)
Responsiveness (RESP) (.74).

Homburg and Pflesser (2000) To develop and validate a measurement model of the market-oriented organizational culture.

Preliminary Work: A content analysis of 50 published reports, and field interviews with 10 managers.

Pretest: 9 managers and 2 academicians.

Survey: 1100 managers in 1100 SBUs from five industries in Germany.
Response rate: 15.7%
Managerial Level (General Layers of Market-Oriented Organizational Culture: Shared Basic Values Supporting Market Orientation, Norms for Market Orientation, Artifacts of Market Orientation, and Market-oriented Behaviors.

A market-oriented organizational culture scale.
A 78-item scale.

Market-oriented Values (.71)
Market-oriented Norms (.72)
Artifacts That Indicate a High Level of Market Orientation (.51)
Artifacts That Indicate a Low Level of Market Orientation (.58)
| **Matsuno et al. (2005)** | To conceptually and empirically compare three different scales of market orientation: Kohli and Jaworski (1990), Narver and Slater (1990) and a newly developed Extended Market Orientation (EMO) scale. The EMO scale was developed using a combination of exploratory qualitative in-depth interviews (a total of 12 business executives), a review of the market orientation literature and two survey pretests of the scale (300 marketing executives for Pretest 1 and 1000 for Pretest 2 of 3300 manufacturing companies in the U.S.). In order to compare three scales, the remaining 2000 marketing executives from the original mailing list were randomly assigned to one of these scales. | Market-oriented Behaviors (.59). Based on the results related to scale reliability, unidimensionality and construct domain, no single scale was found satisfactory. |
| **Ward, Girardi, and Lewandowska (2006)** | To validate Narver and Slater (1990)’s measure of market orientation using structural equation modeling (SEM). A sample of 217 responses from firms operating in four countries: Australia (81 cases), Singapore (79 cases), China (16 cases), and the Netherlands (41 cases). | Customer Orientation (6 items) (0.86) Competitive Orientation (4 items) (0.82) Interfunctional Coordination (5 items) (0.78) Long-Term Horizon (3 items) (0.64) Profit Emphasis (3 items) (0.66). |
| **Modi and Mishra (2010)** | To apply the MKTOR scale to nonprofit organizations and build a reliable and valid scale of the market orientation for the non-profit sector (NPMO). A pilot study of the questionnaire with a 20 senior executives from various nonprofit companies was conducted prior to data collection. The data used for scale development was gathered from a sample of 211 Indian organizations that were engaged in non-profit and rural development activities. | Donor orientation (.79), Peer orientation (.79), Beneficiary orientation (.64), Interfunctional coordination (.81) Overall reliability for NPMO (.82) |
| **Modi (2012)** | To construct a parsimonious, valid scale using the previous 21-item market orientation scale (NPMO) in the context of nonprofit organizations. The data was gathered from 579 nonprofit organizations that deliver community services in India. The data was collected via mail survey. | A 14-item market orientation scale which is parsimonious and efficient. Donor orientation 0.82 Peer orientation 0.83 Beneficiary orientation 0.84 Interfunctional coordination 0.50 |
| **Gyepi-Garbrah and Asamoah** | To develop a holistic measurement scale of internal market managers, marketing managers, and managers from other functional units. IMO was based on the three dimensions: Responsiveness to Intelligence Generation Intelligence Dissemination Responsiveness to the Intelligence Extended Scope of Market Factors: Customers Competition Suppliers Regulatory Factors Social/Cultural Trends Macroeconomic Environment. | The conceptual framework proposed was not tested in this study.
(2015) orientation (IMO) of a firm.

Jangl (2016) To validate the Modified Market Orientation Scale (MMOS) which consists of four dimensions and 12 items in the German high-tech context. The data was collected from a sample of 374 business and marketing managers of German high-tech companies in the manufacturing industry.

A 7-point Likert scale was used.

3.2 Comparison and Criticism of Market Orientation Scales

A stream of research on market orientation measurement scales has focused on making a comparison or criticism of the extant measurement scales (e.g., Deshpandé & Farley, 1996; Oczkowski & Farrell, 1998; Wrenn, 1997). However, the number of comparison/criticism studies of the market orientation scales has been limited to date. These studies either criticized or made comparisons of various measures of the market orientation construct (e.g., Oczkowski & Farrell, 1998). These studies have mostly compared or criticized the two major market orientation scales developed by Narver and Slater (1990) and Kohli et al. (1993). Unfortunately, other than the insights provided by these studies, there is not much guiding information for researchers on how to select the best possible scale (with acceptable psychometric properties) among multiple scales of the same construct (Oczkowski & Farrell, 1998). Even though the number of the market orientation scales has increased considerably over the years, there is still a lack of research on how to discriminate between the various measurements of market orientation.

Kohli et al. (1993) recognized MKTOR as being the most comprehensive one, with many positive characteristics. However, they criticized it in terms of its theoretical foundation. According to them, the MKTOR scale has three shortcomings. First, it follows a focused view of markets by focusing on customers and competitors and by ignoring the additional factors (e.g., technology, regulation etc.) that influence customer needs and preferences. Second, it fails to explain the speed with which market intelligence is generated and disseminated within the organization. Finally, it does not cover specific activities and behaviors representing a market orientation in an organization (Kohli et al., 1993).

On the other hand, the MARKOR scale is criticized for focusing too much on intelligence generation and dissemination, and giving a very narrow conceptualization of a market orientation. Also, this conceptualization of a market orientation does not comprehend necessary measures that best reflect the basics of generating value to customers (Pelham, 1993; Oczkowski & Farrell, 1998, p.362). Pelham (1993) questioned the theoretical background of the MARKOR scale, and viewed the MKTOR scale as superior to the MARKOR scale in terms of reliability and the generation of a simple structure (also see Oczkowski & Farrell, 1998). However, Kara, Spillan, and DeShields (2005) tested the MARKOR scale over a sample of small –sized service retailers and concluded that the MARKOR scale provided a good measure of market orientation in their research setting.

The conflicting views on the reliability and validity of the two widely-used scales have created the need for further empirical research. The study by Oczkowski and Farrell (1998) was aimed at fulfilling this important need and void in the literature. The authors tried to develop a methodology that discriminates among alternative measures of the market orientation construct, including MKTOR and MARKOR. They assessed these scales in terms of their ability to predict a dependent variable (i.e., business performance). In other words, they used criterion or concurrent validity as a guide in the selection of the measures (Oczkowski & Farrell, 1998). Business performance was measured with customer retention, new product success, sales growth, return on investment, and overall performance. The independent variables utilized included market orientation, relative size, relative cost, ease of entry, supplier power, buyer power, market growth, competitive intensity, market turbulence, and...
technological turbulence. For the analysis, two sampling frames were utilized. One sample consists of 861 publicly-traded companies from the Dun and Bradstreet. The other contained 1164 privately-owned companies from the Dun and Bradstreet in Australia. The survey was conducted at the corporation level. The key informant was the CEO/General Manager. Response rates of 29.2% for publicly-listed and 17.1% for privately-owned companies were reached (Oczkowski & Farrell, 1998). The study results showed that the MKTOR scale outperformed the MARKOR scale. MKTOR was found to be superior in explaining variations in measures of business performance (Oczkowski & Farrell, 1998). MKTOR with the Cronbach’s alphas of 0.921 and 0.905 has a greater reliability than MARKOR with the Cronbach’s alphas of 0.868 and 0.884. This means that MKTOR provides more consistent or similar market orientation scores than MARKOR across different samples. But, there was a possibility that the continuous use of non-nested tests with OLS regression and summated scales may have distorted or masked the true performance of measurement scales (Oczkowski & Farrell, 1998). The results of this study should be interpreted with caution, since the results come from only one empirical study.

More empirical testings are necessary to confidently conclude that MKTOR is better than MARKOR or vice versa. Ward et al. (2006) attempted to validate the MKTOR scale in a multiple-country context using structural equation modeling (SEM). They concluded that the MKTOR measure is more likely a collection of three separate measures rather than having the one dimension encompassing the 15 items as suggested by Narver and Slater (1990). They argued that this result might explain the conflicting results in some studies since the individual impact of customer and competitive orientation on performance has not been investigated in most of these studies. Modi and Mishra (2010) applied the MKTOR scale to non-profit organizations and constructed a reliable and valid scale of the market orientation using a sample of 211 Indian nonprofits. This scale was labelled as NPMO (nonprofit market orientation). Later, Modi (2012) refined this 21-item scale and developed a 14-item, more parsimonious scale. The data for this study was obtained from 579 nonprofit organizations that delivered community services in India. This scale was found to be free of the adverse effects of social desirability and common method biases. Jangl (2016) validated a shortened, 12-item version of the Modified Market Orientation Scale (MMOS) using a sample of 374 business and marketing managers from German high-tech companies in the manufacturing industry. This scale was mainly derived from the scales from Kohli et al. (1993), Narver and Slater (1990), and Mohr, Sengupta, and Slater (2014).

4. Conclusions and Roadmap for Future Research

Several conclusions have been drawn based on the review of the research on the definition / conceptualization and measurement of market orientation. Also, a number of suggestions for future research were made in relation to the conclusions drawn from this review: First, it was determined that throughout the literature a set of different terms have been used interchangeably to address a market orientation. The terms such as marketing orientation, the marketing concept, market-oriented, market-driven, customer orientation, customer focus, customer-led, customer-focused, customer-oriented, and customer-centric are often used synonymously. Using different terms to address the same concept has caused confusion among scholars and complicated the understanding of the scope of a market orientation. Researchers need to be careful in their selection of terms to address market orientation. They should select and use the terms that best represent the domain of a market orientation.

Second, even though there is no consensus on the definition of market orientation among scholars, the proposed definitions of market orientation have some mutual characteristics. Although there is no single definition that scholars appear to be agreed on, the definitions of market orientation that were suggested by Kohli and Jaworski (1990), and Narver and Slater (1990) have been widely-accepted and frequently-cited by marketing scholars throughout the literature. However, the future research still needs to work on developing a more precise definition of market orientation that consolidates the proposed definitions of market orientation.

Third, a group of researchers suggested broadening the scope of the market orientation construct to include proactive responsiveness or market insight or the driving markets concept (e.g., Chandy & Tellis, 1998; Jaworski & Kohli, 1996; Jaworski, Kohli, & Sahay, 2000; Narver et al., 2004). The future research should look into this issue more closely.

Fourth, the earliest, reliable, comprehensive, multi-item measures of market orientation were developed by Narver and Slater (1990) and Jaworski and Kohli (1993). These two scales are well-accepted by scholars and frequently-used in empirical studies pertaining to market orientation. Many market orientation studies adopt one of these scales and try to validate it in different business or geographic settings. These two scales also serve as a basis for the development of more refined scales. The research in this area has been directed toward developing more parsimonious market orientation scales. Certainly, there is a pressing need for developing more
parsimonious and generalizable scales that can be used by marketing executives in assessing their companies' degree of market orientation and identifying problematic areas in the application of market orientation (Gray et al., 1998). Future research should focus on developing more parsimonious scales that have potential for global and inter-industry applications.

Fifth, the behavioral/activities/process and cultural perspectives on market orientation complement one another rather than being alternative to each other. According to Deshpandé (1999, p.6), a market orientation can be viewed at three levels: a culture (the shared set of values and beliefs regarding putting customers first), a strategy (creating continuously superior value for a firm's customers), and a series of tactics (the set of cross-functional processes and activities directed as creating and satisfying customers). Viewing a market orientation as a combination of culture, strategy and tactics can help researchers eliminate the division between the behavioral/activities/process and cultural perspectives of market orientation and enable them to examine these two perspectives under the same construct.

Finally, all of the scales developed so far have some shortcomings along with some advantages. There are no simple criteria that could be used by researchers to understand whether any one measurement scale is superior to others. The existent scales of market orientation should be contrasted in terms of their superiority in predicting a dependent variable and in terms of their applicability to various business and nonbusiness contexts. What has been done in this regard thus far is not sufficient and more research is needed.
