Abstract

Certain characterizations of recently proposed univariate continuous distributions are presented in different directions. This work contains a good number of reintroduced distributions and may serve as a source of preventing the reinvention and/or duplication of the existing distributions in the future.

Keywords: Univariate continuous distributions, Hazard function, Reverse hazard function, Characterizations

1. Introduction

This work is a continuation of our previous works (Hamedani and Safavimanesh, 2016), (Hamedani, 2017) and (Hamedani, 2018) on characterizations and infinite divisibility of distributions introduced in 2016-2018. The current work and our previous published papers mentioned above may serve as a source of preventing the reinvention and/or duplication of the existing distributions in the future. As pointed out in our papers, a good number of proposed distributions have already been introduced in the literature. We believe the authors should do a detailed literature search before spending time on the already existing distributions. In designing a stochastic model for a particular modeling problem, an investigator will be vitally interested to know if their model fits the requirements of a specific underlying probability distribution. To this end, the investigator will rely on the characterizations of the selected distribution. Thus, the problem of characterizing a distribution is an important problem in various fields and has recently attracted the attention of many researchers. Consequently, various characterization results have been reported in the literature. These characterizations have been established in different directions. This work deals with various characterizations of Erlang-Lindley (EL) distribution of Abd El-Monsef et al.; Exponentiated Transmuted Weibull Geometric (ETWG) distribution of Fattah et al.; Transmuted Generalized Exponential (TGE) of Khan et al.; Truncated Inverted Generalized Exponential (TIGE) distribution of Genç; Transmuted Generalized Inverted Exponential (TGIE) distribution of Elbatal; Kumaraswamy GEV (KumGEV) distribution of Eljabari and Nadarajah; Generalized Exponential-G (GEG) distribution of Maurya et al.; Type II Odd Lindley Exponential (TIOLE) distribution of Korkmaz and Yousof; Burr-X Exponentiated Fréchet (BXFEP) distribution of Zayed and Butt; Exponentiated Lomax Geometric (ELG) distribution of Hassan and Abd-Allah; Exponential Pareto Power Series (EPSS) distribution of Elbatal et al.; Transmuted Weibull Fréchet (TWFr) distribution of Ahsan ul Haq et al.; Extended Burr XII (EBXII) distribution of Aboueilmaagd et al.; Generalized Weibull Burr XII (GWBXII) distribution of Maksaei and Altun; Burr Type XII (BTXII) distribution of Kumar; Gamma Burr XII (GBXII) of Guerra et al.; Generalized Marshall-Olkin-Kumaraswamy-G (GMOKw-G) family of distributions of Chakraborty and Handique; Weibull Burr X (WBX) distribution of Ibrahim et al.; Kumaraswamy Transmuted Pareto (KwTP) distribution of Chhetri et al.; Odd Log-Logistic Logarithmic Generated (OLL-G) family of distributions of Alizadeh et al.; Marshall-Olkin Extended Inverse Pareto (MOEIP) distribution of Gharib et al.; Marshall-Olkin Extended Inverse Weibull (MOEIW) distribution of Okasha et al.; Upper Truncated Lindley (UTL) distribution of Singh et al.; Transmuted Exponentiated Fréchet (TEF) distribution of Elbatal et al.; Generalized Inverted Generalized Exponential (GIGE) distribution of Oguntunde and Adejumo; Transmuted Rayleigh (TR) distribution of Ahmad et al.; McDonald Quasi Lindley (McQL) distribution of Roozegar and Esfandiyari; Geometric Weibull Poisson (GWP) distribution of Mansour and Abd Elrazik; SS Transformation of Exponential (STSE) distribution of Kumar et al.; Generalization of the BurrXII-Poisson (GBXIIIP) distribution of Muhammad; Log-Logistic Generated Weibull (LLGW) distribution of Abdel-Hamid and Albasuoni; Odd Generalized Exponentiated Linear Failure Rate (OGLFR) distribution of El-Damcese et al.; Transmuted Exponentiated Inverse Rayleigh (TEIR) distribution of Ahsan ul Haq; Transmuted Two-Parameter Lindley (TTL) distribution of Al-Khazaleh et al.; Transmuted Janardan (TJ) distribution of Al-Omari et al.; Exponentiated Generalized Weibull-Gompertz (EGWG) distribution of El-Bassiouny et al.; Complementary Exponentiated BurrXII Poisson (CEBXIIP) distribution of Muhammad; Kumaraswamy Power Function (Kw-PF) distribution of Abdul-Moniem; Odd Burr III-G (OBIII-G) family of distributions of Jamal et al.; Odd Generalized Exponential Generalized Linear Exponential (OGE-GLE) distribution of Luguterah and Nasiru;
Exponentiated Inverse Flexible Weibull Extension (EIFWFE) distribution of El-Morshedy et al.; Transmuted Weighted Exponential (TWE) distribution of Dar et al.; Beta Transmuted Pareto (BTP) distribution of Chherti et al.; Generalized Burr-G (GBG) family of distributions of Nasir et al.; Exponentiated Weibull-Power Function (EWPF) distribution of Hassan and Assar; Transmuted Two-Parameter Lindley (TTL) distribution of Kemaloglu and Yilmaz; Marshall-Okin Log-Logistic Extended Weibull (MOLLEW) distribution of Lepetu et al.; Modified Slash Birnbaum-Saunders (MSBS) distribution of Reyes et al.; Inverse Power Lindley (IPL) distribution of Barco et al.; Weibull Weibull (WW) distribution of Abouelmagd et al.; Beta Generated Kumaraswamy-G (BGKw-G) family of distributions of Handique et al.; New Life Model (NLM) of Muhammad; Marshall-Okin Exponentiated Burr XII (MOEBXII) distribution of Cordeiro et al.; Beta Nadarajah-Haghighi (BNH) distribution of Dias et al.; New Two-Parameter Weibull (NTPW) distribution of Rasekhi et al.; Generalized Half-t (GHT) distribution of Bulut et al.; Gamma Extended-G (GE-G) distribution of Cordeiro et al.; Modified Behrens-Fisher (MB-F) distribution of Nadarajah and Li; Maxwell-Weibull (M-W) distribution of Sharma et al.; Exponentiated Weibull-Exponential (EWE) distribution of Elgarhy et al.; $\alpha$ Logarithmic Transformed ($\alpha$LT) family of distributions of Dey et al.; Topp-Leone Odd Log-Logistics (TOLL) family of distributions of Brito et al.; Two-Parameter Maxwell (TP-M) distribution of Dey et al.; Generalized Quadratic Hazard Rate (GQHR) distribution of Sarhan; New Four-Parameter Weibull (NF PW) distribution of Yousof et al.; Odd Lindley Burr XII (OLBXII) distribution of Abouelmagd et al.; Dagum Poisson (DP) distribution of Ouyede et al.; Burr XII Modified Weibull (BXIIMW) of Mdlongwa et al.; Burr X Pareto (BXP) of Korkmaz et al.; General Class of Flexible Weibull (GCFW) distributions of Park and Park; Power Lomax Poisson (PLP) distribution of Hassan and Nassr; Modified Weibull Poisson (MWP) distribution of Ghorbani et al.; Exponentiated Power Lindley Geometric (EPLG) distribution of Alizadeh et al.; Generalized Modified Weibull Power Series (GMWPS) distribution of Bagheri et al.; Additive Modified Weibull Odd Log-Logistic-G (AMWOLLG) family of distributions of Ghorbani et al.; Exponentiated Power Lindley Power Series (EPLPS) distribution of Alizadeh et al.; Weibull-R (W-R) family of distributions of Ghosh and Nadarajah; Wrapped Lindley (WL) distribution of Joshi and Jose; Beta Weibull-G family of distributions of Makubate et al.; Transmuted Weibull Regression (TWR) distribution of Granzotto et al. These characterizations are presented in different directions: (i) based on the ratio of two truncated moments; (ii) in terms of the hazard function; (iii) in terms of the reverse (reversed) hazard function and (iv) based on the conditional expectation of certain function of the random variable. Note that (i) can be employed also when the $cdf$ (cumulative distribution function) does not have a closed form. In defining the above distributions we shall try to employ the same parameter notation as used by the original authors. We follow the same order as listed above.

1) The $cdf$ of EL is given by

$$F(x; \theta, k) = 1 - \frac{1}{\Gamma(k)(1 + \theta)^{2}} \left\{ \theta \Gamma(k) e^{-\theta x} (1 + \theta + \theta x) + (1 + \theta) \Gamma(k, \theta x) \right\},$$

$x \geq 0$, where $\theta > 0$ and $k \in \mathbb{N}$ are parameters and $\Gamma(k, x) = \int_{x}^{\infty} w^{k-1} e^{-w} dw$.

2) The $cdf$ of ETWG is given by

$$F(x; \alpha, \beta, \sigma, \lambda, p) = \frac{1 - e^{-(\frac{x}{\beta})^\alpha} \left[ 1 + \beta e^{-(\frac{x}{\beta})^\alpha} \right]^p}{1 - p + p \left[ 1 - e^{-(\frac{x}{\beta})^\alpha} \right]^p \left[ 1 + \lambda e^{-(\frac{x}{\beta})^\alpha} \right]^p}, \quad x \geq 0,$$

where $\alpha, \beta, \lambda$ are all positive, $|\lambda| \leq 1$ and $p \in (0, 1)$ are parameters.

3) The $cdf$ of TGE is given by

$$F(x; \alpha, \theta, \lambda) = \left[ 1 - e^{-\theta x} \right]^{\alpha} \left[ 1 + \lambda - \lambda \left( 1 - e^{-\theta x} \right)^{\alpha} \right], \quad x \geq 0,$$

where $\alpha, \theta$ both positive and $|\lambda| \leq 1$ are parameters.

**Remark 1.** The TGE distribution of Khan et al. (2017b) is a special case of TEAW distribution of Nofal et al. (2017), which has already been characterized in Hamedani (2017a). We believe that Khan et al. were not aware of Nofal et al.’s paper.

4) The $cdf$ of TIGE is given by

$$F(x; \alpha, \lambda) = E - C \left( 1 - e^{-\lambda x} \right)^\alpha, \quad 0 \leq B \leq x \leq A < \infty,$$

where $\alpha, \lambda$ are positive parameters and $E = \left\{ (1 - e^{-\lambda A})^\alpha \left( 1 - e^{-\lambda B} \right)^{\alpha - 1} \right\}^{-1}, C = E \left( 1 - e^{-\lambda A} \right)^\alpha$. 

37
Remark 2. The TIGE distribution of Genç (2017) is a special case of INGIW distribution of Khan et al. (2017b), which has already been characterized in Hamedani (2017b). We believe that Genç was not aware of Khan et al.’s paper.

5) The cdf of TIGE is given by

\[
F(x; \alpha, \theta, \lambda) = \left(1 - \left(1 - e^{-\theta/x}\right)^\alpha\right)\left(1 + \lambda \left(1 - e^{-\theta/x}\right)\right), \quad x \geq 0,
\]

where \(\alpha, \theta\) both positive and \(|\lambda| \leq 1\) are parameters.

Remark 3. The TIGE distribution of Elbatal (2013) is a special case of TNGIW distribution of Khan et al. (2017a), which has already been characterized in Hamedani (2017b).

6) The cdf of KumGEV (WLOG, for \(\mu = 0, \sigma = 1\)) is given by

\[
F(x; a, b, \eta) = 1 - \left[1 - \exp\left(-a \left(1 + \eta x\right)^{-1/\eta}\right)\right]^b, \quad x \geq 0,
\]

where \(a, b, \eta\) are all positive parameters.

7) The cdf of GEG is given by

\[
F(x; \alpha) = \exp\left\{\left(G(x)\right)^\alpha - 1\right\} - e^{-1}, \quad x \in \mathbb{R},
\]

where \(\alpha > 0\) is a parameter and \(G(x), g(x)\) are cdf and pdf (probability density function) of the baseline distribution.

Remark 4. One may add another parameter to GEG and express (7) as

\[
F(x; \alpha, \beta) = \exp\left\{\beta \left(G(x)\right)^\alpha - 1\right\} - e^{\beta - 1}, \quad x \in \mathbb{R}.
\]

8) The cdf of TIIOLE is given by

\[
F(x; \lambda) = 1 - \frac{1 + \exp(-\lambda x)}{2 \exp(-\lambda x)} \exp\left\{1 - \exp(\lambda x)\right\}, \quad x \geq 0,
\]

where \(\lambda > 0\) is a parameter.

Remark 5. The TIIOLE distribution of Korkmaz and Yousof (2017) is a special case of OL-G distribution of Gomez-Silva et al. (2017), which has been characterized in Hamedani (2017a).

9) The cdf of BXEF is given by

\[
F(x; \theta, \lambda, \beta, \alpha) = \left\{1 - \exp\left(-\left[1 - \left(1 - e^{-\alpha x} \right)^{\alpha}\right]^{\beta}\right)^{\theta}\right\}, \quad x \geq 0,
\]

where \(\theta, \lambda, \beta, \alpha\) are all positive parameters.

Remark 6. The BXEF distribution of Zayed and Butt (2017) is a submodel of BX-G distribution introduced by Yousof et al. (2016), which has been characterized in Hamedani (2017a).

10) The cdf of ELG is given by

\[
F(x; \alpha, \theta, \lambda, p) = \frac{\left[1 - (1 + \lambda x)^{-\theta}\right]^\alpha}{1 - p \left[1 - \left(1 - (1 + \lambda x)^{-\theta}\right)^{\alpha}\right]}, \quad x \geq 0,
\]

where \(\alpha, \theta, \lambda, p\) all positive and \(p (0 < p < 1)\) are parameters.

11) The cdf of EPPS is given by

\[
F(x; \alpha, \theta, \lambda, \mu) = 1 - \frac{c(\theta e^{-\theta(x)})}{c(\theta)}, \quad x \geq 0,
\]

where \(\alpha, \theta, \lambda, \mu\) are all positive parameters and \(c(\theta) = \sum_{n=1}^{\infty} a_n \theta^n, a_n \geq 0\).
Remark 7. The EPPS distribution of Elbatal et al. (2017) is a submodel of RGTLPS distribution introduced by Condino and Domma (2016), which has been characterized in Hamedani (2017a).

12) The cdf of TWFr, for $a = 1$, is given by

$$F(x; \beta, \gamma, \lambda, 1, b) = \left(1 - \exp \left[-\left(\frac{e^{(1)^\beta}}{1-e^{(1)^\beta}}\right)^b\right]\right) \times \left(1 + \lambda \exp \left[-\left(\frac{e^{(1)^\beta}}{1-e^{(1)^\beta}}\right)^b\right]\right), \quad x \geq 0,$$

where $\beta, \gamma, b$ all positive and $\lambda (|\lambda| \leq 1)$ are parameters.

13) The cdf of EBXII is given by

$$F(x; \alpha, \beta, \nu, a, b) = \left(1 - \exp\left\{\frac{-\alpha}{(1 + x^a)^\beta - 1}\right\}\right)^\nu, \quad x \geq 0,$$

where $\alpha, \beta, \nu, a, b$ are all positive parameters.

Remark 8. The EBXII distribution of Abouelmagd et al. (2017) is a minor extension of FPBXII distribution introduced by Afify et al. (2017), which has been characterized in Hamedani (2017a).

14) The cdf of GWBXII is given, by the authors as

$$F(x; \alpha, \beta, s, u, k) = 1 - \exp \left\{-a \left[\log \left[1 + \left(\frac{x}{s}\right)^{u-k}\right]\right]\right\}, \quad x \geq 0.$$ 

It is easy to see that the cdf can be written as

$$F(x; \alpha, \beta, s, u, k) = 1 - \exp \left\{-ak\beta \left[\log \left[1 + \left(\frac{x}{s}\right)^{u}\right]\right]\right\}, \quad x \geq 0.$$ 

and WLOG, we can set $k = 1$.

Therefore, the cdf of GWBXII (WLOG, we can set $k = 1$) is given by

$$F(x; \alpha, \beta, s, u, 1) = 1 - \exp \left\{-a \left[\log \left[1 + \left(\frac{x}{s}\right)^{u}\right]\right]\right\}, \quad x \geq 0,$$

where $\alpha, \beta, s, u$ are all positive parameters.

15) The cdf of BTXII is given by

$$F(x; \alpha, \beta) = 1 - (1 + x^\alpha)^\beta, \quad x \geq 0,$$

where $\alpha, \beta$ are all positive parameters.

Remark 9. The BTXII distribution of Kumar (2017) is a special submodel of TBTXII distribution introduced by Al-Khazaleh (2016), which has been characterized in Hamedani (2017a).

16) The cdf of GBXII is given by

$$F(x; a, c, d, s) = \frac{\gamma(a,d \log \left[1 + \left(\frac{x}{s}\right)^d\right])}{\Gamma(a)}, \quad x \geq 0,$$

where $a, c, d, s$ are all positive parameters and $\gamma(a,z) = \int_0^z t^{a-1}e^{-t}dt$. 

Remark 10. The GBXII distribution of Guerra et al. (2017) is a special submodel of G-P distribution introduced by Alzaatreh et al. (2012) as well as a special submodel of GEW distribution of Cordeiro et al. (2016). Both distributions (G-P and GEW) have been characterized in the Research Monograph by Hamedani and Maadooliat (2017).

17) The cdf of GMOKw-G is given by

\[
F(x; \alpha, \theta, a, b) = 1 - \left[ \frac{\alpha [1 - G(x)^\alpha]^b}{1 - (1 - a) [1 - G(x)^\alpha]^b} \right]^\theta, \quad x \in \mathbb{R},
\]

where \(\alpha, \theta, a, b\) are all positive parameters and \(G(x)\) is the baseline cdf with corresponding pdf \(g(x)\).

Remark 11. A slightly more general case of the GMOKw-G distribution has been characterized in Hamedani (2017a).

18) The cdf of WBX is given by

\[
F(x; \alpha, \beta, \theta, \lambda) = 1 - \exp \left\{ -\alpha \left( \frac{1 - e^{-(\lambda x)^\beta}}{1 - (1 - \theta)^\beta} \right)^\theta \right\}, \quad x \geq 0,
\]

where \(\alpha, \beta, \theta, \lambda\) are all positive parameters.

19) The cdf of KwTP is given by

\[
F(x; \alpha, \theta, \lambda, a, b) = 1 - \left[ 1 - G(x; \alpha, \theta, \lambda)^\alpha \right]^b, \quad x \in \mathbb{R},
\]

\[
= 1 - \left\{ 1 - \left[ 1 - \left( \frac{\theta}{\lambda} \right)^\alpha \right]^\theta \left[ 1 + \lambda \left( \frac{\theta}{\lambda} \right)^\alpha \right] \right\}^b, \quad x \geq 0,
\]

where \(\alpha, \theta, a, b\) all positive and \(\lambda (|\lambda| \leq 1)\) are parameters.

Remark 12. The distribution \(F(x; \alpha, \theta, \lambda, a, b) = 1 - \left[ 1 - G(x; \alpha, \theta, \lambda)^\alpha \right]^b, \quad x \in \mathbb{R},\) has been considered by several authors before. In fact a more general case was proposed by Mahmoud et al. (2015). For \(\lambda = 0\), the cdf (37) was taken up by Bourguignon et al. (2013).

20) The cdf of OLLL-G is given by

\[
F(x; \alpha, \beta, \eta) = \frac{1}{\log(1 - \beta)} \log \left[ 1 - \frac{\beta G(x; \eta)^\alpha}{G(x; \eta)^\alpha + G(x; \eta)^\alpha} \right], \quad x \in \mathbb{R},
\]

where \(\alpha > 0, 0 < \beta < 1\) are parameters and \(G(x; \eta)\) is the baseline cdf with corresponding pdf \(g(x; \eta)\).

Remark 13. The Zografos-Balakrishnan Odd Log-Logistic (ZBOLL-G) distribution with cdf

\[
F(x; \alpha, \beta, \tau) = \frac{1}{\Gamma(\beta)} \gamma \left[ \beta - \log \left\{ 1 - \frac{G(x; \tau)^\alpha}{G(x; \tau)^\alpha + G(x; \tau)^\alpha} \right\} \right],
\]

where \(x \in \mathbb{R}, \alpha > 0, \beta > 0\) was proposed by Cordeiro et al. (2016). The OLLL-G distribution seems to be a simple variation of ZBOLL-G, which has been characterized in the Research Monograph by Hamedani and Maadooliat (2017).

21) The cdf of MOEIIP is given by

\[
F(x; \alpha, \beta, \delta) = 1 - \delta \left[ 1 - \left( \frac{x}{x + \beta} \right)^\alpha \right] \left\{ \delta - (\delta - 1) \left( \frac{x}{x + \beta} \right)^\alpha \right\}^{-1}, \quad x \geq 0,
\]

where \(\alpha, \beta, \delta\) are positive parameters.

Remark 14. \(\bar{F}(x)\) in equation (6) of Gharib et al. (2017) should be replaced with \(F(x)\).

22) The cdf of MOEIW is given by

\[
\text{...}
\]
\[ F(x; \alpha, \beta, \theta) = e^{-\alpha x \theta} \left[ \theta - (\theta - 1) e^{-\alpha x \theta} \right]^{-1}, \quad x \geq 0, \]  

where \( \alpha, \beta, \theta \) are positive parameters.

**Remark 15.** The MOEIW distribution was introduced under the name of Marshall-Olkin Fréchet (M-OF) distribution by Krishna et al. (2013). The latter has been characterized in the Research Monograph by Hamedani and Maadooliat (2017).

23) The cdf of UTL is given by

\[ F(x; \theta, \eta) = e^{\theta \eta \left\{ 1 + \theta - [1 + \theta (1 + x)] e^{-\theta x} \right\}} \left[ 1 + \lambda \left( 1 - e^{-\gamma (\frac{x}{\lambda})^\alpha} \right)^\alpha \right], \quad x \geq 0, \]  

where \( \theta, \eta \) are positive parameters.

24) The cdf of TEF is given by

\[ F(x; \alpha, \beta, \theta, \lambda) = \left[ 1 - \left( 1 - e^{-\gamma (\frac{x}{\lambda})^\alpha} \right)^\alpha \right] \left[ 1 + \lambda \left( 1 - e^{-\gamma (\frac{x}{\lambda})^\alpha} \right)^\alpha \right], \quad x \geq 0, \]  

where \( \alpha, \beta, \theta \) positive and \( \lambda (|\lambda| \leq 1) \) are parameters.

25) The cdf of GIGE is given by

\[ F(x; \alpha, \gamma, \lambda) = 1 - \left( 1 - e^{-\gamma (\frac{x}{\lambda})^\alpha} \right)^\alpha, \quad x \geq 0, \]  

where \( \alpha, \gamma, \lambda \) are positive parameters.

**Remark 16.** The GIGE distribution is a special case of, at least two distributions. We mention here, the Exponentiated-Exponential Fréchet (EEFr) distribution of Mansoor et al. which has been characterized in the Research Monograph by Hamedani and Maadooliat (2017).

26) The cdf of TR is given by

\[ F(x; \theta, \lambda) = \left( 1 - \exp \left( -\frac{x^2}{2\theta^2} \right) \right) \left[ 1 + \lambda \exp \left( -\frac{x^2}{2\theta^2} \right) \right], \quad x \geq 0, \]  

where \( \theta, \lambda \) are positive parameters.

27) The cdf of McQL is given by

\[ F(x; a, b, c, \alpha, \theta) = I \left( \left[ 1 - \frac{1 + \alpha + \theta x}{\alpha + 1} e^{-\alpha x} \right]^{-\alpha} ; a/c, b \right), \quad x \geq 0, \]  

where \( a, b, c, \theta \) all positive and \( \alpha > -1 \) are positive parameters.

**Remark 17.** The TR distribution is a special case of the Kumaraswamy-Transmuted Exponentiated Modified Weibull (Kw-TEMW) distribution of Al-babtain et al. (Communications in Statist. Theory-Methods, forthcoming) which has been characterized in Hamedani (IJSP, forthcoming).

28) The cdf of GWP is given by

\[ F(x; \alpha, \beta, \lambda, \pi) = \frac{(1 - \pi) \left[ 1 - \exp \left( -\lambda + \lambda e^{-\beta \pi x} \right) \right]}{1 - e^{-x} - \pi + \pi \exp \left( -\lambda + \lambda e^{-\beta \pi x} \right)}, \quad x \geq 0, \]  

where \( \alpha, \beta, \lambda \) all positive and \( \pi (0 < \pi < 1) \) are parameters.

29) The cdf of SSTE is given by
\[ F(x; \theta) = \cos \left( \frac{\pi}{2} e^{-\theta x} \right), \quad x \geq 0, \quad (29) \]

where \( \theta > 0 \) is a parameter.

30) The cdf of GBXIIP is given by

\[ F(x; a, \alpha, \beta, \lambda) = \left( \frac{1 - \exp \left( \lambda \left( (1 + x)^{\alpha} - 1 \right) \right)}{1 - e^{-\lambda}} \right)^a, \quad x \geq 0, \quad (30) \]

where \( a, \alpha, \beta, \lambda \) are positive parameters.

31) The cdf of LLGW is given by

\[ F(x; \alpha, \beta, \gamma) = 1 - (1 + (\alpha x^\beta))^{-1}, \quad x \geq 0, \quad (31) \]

where \( \alpha, \beta, \gamma \) are positive parameters.

Remark 19. The LLGW distribution of Abdel-Hamid and Albasuoni (2016) is a special submodel of TBTXII distribution introduced by Al-Khazaleh (2016), which has been characterized in Hamedani (2017a). Furthermore, LLGW distribution reduces to BTXII distribution for \( \gamma = 1 \), please see Remark 9.

32) The cdf of OGELFR is given by

\[ F(x; \alpha, \beta, a, b) = \left[ 1 - e^{-\alpha \left( e^{a x^\beta} + b^2 x^2 - 1 \right)} \right] \beta, \quad x \geq 0, \quad (32) \]

where \( \alpha, \beta, a, b \) are positive parameters.

Remark 20. The OGELFR distribution of El-Damcese et al. (2016) is a special submodel of Exponentiated Weibull Rayleigh (EWR) distribution of Elgarhy, which has been characterized in Hamedani (2017a).

33) The cdf of TEIR is given by

\[ F(x; \alpha, \beta, \theta, \lambda) = \left( e^{-\theta x^\beta} \right) \left[ 1 + \lambda - \lambda \left( e^{-\theta x^\beta} \right) \right], \quad x \geq 0, \quad (33) \]

where \( \alpha, \beta, \theta \) are positive and \( \lambda (|\lambda| \leq 1) \) are parameters.

Remark 21. The TEIR distribution of Ahsan ul Haq (2016) is a special submodel of Transmuted Kumaraswamy Exponentiated Inverse Rayleigh (TKEIR) distribution of Badr (2017), which has been characterized in Hamedani (2017a).

34) The cdf of TTL is given by

\[ F(x; \alpha, \theta, \lambda) = \frac{e^{-2\theta x} \left( \theta e^{\theta x} - 1 + \alpha e^{\theta x} - \theta x - 1 \right) \times \left[ e^{\theta x} (\alpha + \theta) + \lambda (\alpha + \theta + \alpha \theta x) \right]}{\left( \alpha + \theta \right)^2}, \quad x \geq 0, \quad (34) \]

where \( \theta > 0, \alpha > -\theta, \lambda (|\lambda| \leq 1) \) are parameters.

35) The cdf of TJ is given by

\[ F(x; \alpha, \theta) = 1 - \left( 1 + \frac{\theta x}{\theta + \alpha^2} \right) e^{-\frac{x}{\theta + \alpha^2}}, \quad x \geq 0, \quad (35) \]

where \( \theta > 0, \alpha > 0 \) are parameters.

Remark 22. The TJ distribution of Al-Omari et al. (2017) is similar to the Maxwell Length Biased (MLB) distribution of Saghir et al. (2016) whose cdf is \( F(x; \alpha, \theta) = 1 - (1 + \frac{x^2}{\alpha^2}) e^{-\frac{x}{\alpha^2}}, \quad x \geq 0 \). The MLB distribution has been characterized in Hamedani (2017a).
36) The \(cdf\) of EGWG is given by
\[
F(x; a, b, c, d, \theta) = \left[ 1 - e^{-ax^{b}(e^{cd} - 1)} \right]^\theta, \quad x \geq 0, \tag{36}
\]
where \(a, b, c, d, \theta\) are all positive parameters.

**Remark 23.** The EGWG distribution of El-Bassiouny et al. (2017) is the same as the one proposed by El-Damcese et al. (2015). The EGWG distribution is in turn a special case of EWR distribution of Elgarhy (2015) which has been characterized in Hamedani (2017a).

37) The \(cdf\) of CEBXIIP is given by
\[
F(x; \alpha, \beta, \lambda, \theta) = \exp\left(\lambda \left[1 - (1 + x^\alpha)^{-\beta}\right]^{-\theta} - 1\right), \quad x \geq 0, \tag{37}
\]
where \(\alpha, \beta, \lambda, \theta\) are all positive parameters.

**Remark 24.** The CEBXIIP distribution of Muhammad (2017) is a special case of Poisson-G (Po-G) family of distributions of Abouelmagd et al. (2017) if one takes \(G(x) = \left(1 - (1 + x^\alpha)^{-\beta}\right)^\theta\) in the formula for the Po-G distribution. The Po-G distribution has been characterized in Hamedani (2018).

38) The \(cdf\) of Kw-PF is given by
\[
F(x; a, b, \lambda, \theta) = 1 - \left[ 1 - \left(\frac{x}{\lambda}\right)^{ab} \right], \quad 0 \leq x \leq \lambda, \tag{38}
\]
where \(a, b, \lambda, \theta\) are all positive parameters.

39) The \(cdf\) of OBIII-G is given by
\[
F(x; c, \theta) = \left[ 1 + \left(\frac{1 - G(x; \theta)}{G(x; \theta)}\right)^{-k} \right], \quad x \in \mathbb{R}, \tag{39}
\]
where \(c, k, \theta\) are all positive parameters and \(G(x; \theta)\) is the base \(cdf\) with corresponding \(pdf\) \(g(x; \theta)\).

**Remark 25.** The OBIII-G distribution of Jamal et al. (2017) is the same as the one proposed by Arifa et al. (2017), called Modified Burr III G (MBIIIG) distribution, which has been characterized in Hamedani (2017a).

40) The \(cdf\) of OGE-GLE is given by
\[
F(x; \alpha, a, b, c, \lambda) = \left[ 1 - e^{-\alpha \left(\frac{x \lambda^{a}}{b} + 1\right)} \right]^\theta, \quad x \geq 0, \tag{40}
\]
where \(\alpha, a, b, c, \lambda\) are all positive parameters.

**Remark 26.** The OGE-GLE distribution of Luguterah and Nasiru (2017) is a special case of the distribution of Abdelall (2016), called Odd Generalized Exponential Modified Weibull (OGEMW) distribution, which has been characterized in Hamedani and Safavimaneshe (2017).

41) The \(cdf\) of EIFWE is given by
\[
F(x; \alpha, \beta, \lambda) = e^{-\lambda \lambda^{\alpha\beta} x}, \quad x \geq 0, \tag{41}
\]
where \(\alpha, \beta, \lambda\) are all positive parameters.

**Remark 27.** For \(\lambda = 1\), the EIFWE distribution of El-Morshedy et al. (2017) is the same as the one proposed by the same authors (listed in a different order) in (2015), called Inverse Flexible Weibull Extension (IFWE) distribution. The IFWE has been characterized in a Research Monograph by Hamedani and Maadooliat (2017).
42) The \( cd f \) of TWE is given by

\[
F(x; \alpha, \beta, \gamma) = \frac{\Gamma(\omega + 1)}{\Gamma(\omega + 1)^2},
\]

where \( \alpha > 0, \omega \geq 0 \) and \( \beta (|\beta| \leq 1) \) are parameters.

43) The \( cd f \) of BTP is given by

\[
F(x; a, b, x_0) = \frac{1}{B(a, b)} \int_0^{1 - \left( \frac{x}{x_0} \right)^\alpha} \left( \frac{1 - \left( \frac{x}{x_0} \right)^\alpha}{1 + \left( \frac{x}{x_0} \right)^\alpha} \right)^{\!w\!-\!1} (1 - w)^b\!-\!1 \, dw, \quad x \geq x_0,
\]

where \( a, b, \) and \( \lambda (|\lambda| \leq 1) \) are parameters.

**Remark 28.** For \( \alpha = 0 \), the BTP distribution of Chhetri et al. (2017) reduces to Generalized Beta Exponentiated Pareto (GBEP) distribution of Mead (2014). The GBEP distribution has been characterized in the Research Monograph by Hamedani and Maadootiat (2017).

44) The \( cd f \) of GBG is given by

\[
F(x; c, k, \eta) = 1 - \left[ 1 + \left( -\log \left( \frac{G(x; \eta)}{G(x; \eta)} \right) \right)^c \right]^x, \quad x \in \mathbb{R},
\]

where \( c, k \) are positive parameters and \( G(x; \eta) \left( \frac{G(x; \eta)}{G(x; \eta)} \right) = 1 - G(x; \eta) \) is the baseline \( cd f \) with the corresponding \( pd f \) \( g(x; \eta) \), which may depend on the vector parameter \( \eta \).

45) The \( cd f \) of EWPF is given by

\[
F(x; \alpha, \beta, \lambda, \theta, a) = \left[ 1 - \exp \left( -a \left( \frac{x^\beta}{x^\theta - x^\alpha} \right)^\lambda \right) \right]^\eta,
\]

where \( \alpha, \beta, \lambda, \theta, a \) are all positive parameters.

**Remark 29.** For \( \alpha = 1 \), the EWPF distribution of Hassan and Assar (2017) reduces to Weibull Power Function (WPF) distribution of Tahir et al. (2014). The WPF distribution has been characterized in the Research Monograph by Hamedani and Maadootiat (2017).

46) The \( cd f \) of TTL\(_1\) is given by

\[
F(x; \alpha, \theta, \lambda) = (1 + \lambda) \left[ 1 - \left( \frac{1 + \alpha x^\theta}{\theta + \alpha} \right)^{\!-\!1} \right] - \lambda \left[ 1 - \left( \frac{1 + \alpha x^\theta}{\theta + \alpha} \right)^{\!-\!1} \right]^2,
\]

where \( \alpha > 0, \theta > 0, \lambda (|\lambda| \leq 1) \) are parameters.

**Remark 30.** The TTL\(_1\) distribution of Kemaloglu and Yilmaz (2017) is the same as the TTL distribution of Al-Khazaleh et al. (2016). The TTL distribution is numbered 34) in the present work. TTL\(_1\) (TTL) has been characterized in Hamedani (2017a).

47) The \( cd f \) of MOLLEW is given by

\[
F(x; c, \alpha, \delta, \eta) = 1 - \frac{\delta (1 + x^\delta)^{-1} e^{-\alpha H(x; \eta)}}{1 - (1 - \delta)(1 + x^\delta)^{-1} e^{-\alpha H(x; \eta)}}, \quad x \geq 0,
\]

where \( \alpha > 0, \delta > 0 \) are parameters and \( H(x; \eta) \) is a non-negative differentiable function with \( \lim_{x \to 0^+} H(x; \eta) = 0, h(x; \eta) = H'(x; \eta) \), which may depend on the parameter \( \eta \).

48) The \( cd f \) of MSBS is given by

\[
F(x; \alpha, \beta, \gamma) = \int_0^x \frac{\Gamma(\alpha + \beta)}{\alpha \beta} \int_0^\infty u^{\alpha - 1} e^{-u\phi(ua, (\alpha, \beta))} du,
\]

where \( \alpha > 0, \beta > 0, \gamma > 0 \) are parameters and \( \phi(ua, (\alpha, \beta)) \) is a positive function.
$x \geq 0$, where $\alpha, \beta, \gamma$ are positive parameters, $\phi(\cdot)$ is pdf of standard normal distribution and $\phi(\alpha, \beta) = \left(\frac{1}{\sqrt{\pi}} - \frac{1}{\sqrt{\beta}}\right)/\alpha$. 

49) The cdf of IPL is given by 

$$F(x; \alpha, \beta) = \left(1 + \frac{\beta x - \alpha}{1 + \beta}\right)e^{-\beta x - \alpha}, \quad x \geq 0,$$

(49) 

where $\alpha, \beta$ are positive parameters. 

**Remark 31.** The IPL distribution of Barco et al. (2017) is the same as the Generalized Inverse Lindley (GIL) distribution of Asgharzadeh et al. (2016). The GIL distribution has been characterized in Hamedani (2017a). 

50) The cdf of WW is given by 

$$F(x; \alpha, \beta, \lambda, \gamma) = 1 - \exp\left\{-\alpha\left(e^{\gamma x} - 1\right)^{\beta}\right\}, \quad x \geq 0,$$

(50) 

where $\alpha, \beta, \lambda, \gamma$ are positive parameters. 

**Remark 32.** The cdf $F(x; \alpha, \beta, \lambda, \gamma) = \left[1 - \exp\left\{-\alpha\left(e^{\gamma x} - 1\right)^{\beta}\right\}\right]^{\alpha}, \quad x \geq 0$ is of the form (50), which has been characterized in Hamedani (2017a). Similarly, cdfs $F(x; \theta, \gamma, a, b) = 1 - \left[1 - \exp\left\{-\beta\left(e^{\gamma x} - 1\right)\right\}\right]^{\theta}, \quad x \geq 0$ and $F(x; \alpha, \beta, a, b) = 1 - \exp\left\{-\alpha\left(e^{\beta x} - 1\right)^{\gamma}\right\}, \quad x \geq 0$, which have been characterized in the Research Monograph by Hamedani and Maadooliat (2017). 

51) The cdf of BGKw-G is given by 

$$F(x; a, b, m, n) = \frac{1}{B(m, n)} \int_{0}^{1 - \frac{1 - G(x)}{\beta}} t^{m-1} (1 - t)^{n-1} dt,$$

(51) 

$x \geq 0$, where $a, b, m, n$ are positive parameters. 

**Remark 33.** The cdf $F(x; \alpha, \beta) = \frac{1}{\log \alpha} \int_{0}^{\frac{x}{1 - \frac{x}{\alpha}}} t^{\beta-1} (1 - t)^{\beta-1} dt, \quad x \in \mathbb{R}$, where $Q(x)$ is an absolutely continuous cdf has been introduced before and has been characterized in Hamedani (2016). Letting $Q(x) = 1 - \left[1 - G(x)\right]^\beta$ in $F(x; \alpha, \beta)$, we arrive at (101). 

52) The cdf of NLM is given by 

$$F(x; \alpha) = e^{e^{\alpha x} - 1} - 1, \quad 0 \leq x \leq 1,$$

(52) 

where $\alpha$ is a positive parameter. 

53) The cdf of MOEBXII is given by 

$$F(x; \alpha, \lambda, c, p) = \frac{1 - \left\{1 - \left[1 - (1 + x^{c})^{-\lambda}\right]\right\}^{\alpha}}{1 - \alpha\left\{1 - \left[1 - (1 + x^{c})^{-\lambda}\right]\right\}}, \quad x \geq 0,$$

(53) 

where $\alpha, \lambda, c, p$ are all positive parameters and $\alpha = 1 - \alpha$. 

**Remark 34.** The cdf $F(x; \alpha, \lambda, p) = \left\{\frac{1 - [G(x)]^{\lambda}}{1 - p[G(x)]^{\lambda}}\right\}^{\alpha}, \quad x \in \mathbb{R}$, where $G(x)$ a baseline cdf was introduced by Dias et al. (2016). Letting $\alpha = 1$, renaming $p$ as $1 - \alpha$ (for $\alpha > 0$) and $G(x) = \left(1 - \left[1 - (1 + x^{c})^{-\lambda}\right]\right)^{1/\lambda}, \quad x \geq 0$, we arrive at (53). Thus, cdf (53) is a special case of Dias et al. distribution. 

54) The cdf of BNH is given by 

$$F(x; \alpha, \lambda, a, b) = \frac{1}{B(a, b)} \int_{0}^{1 - \exp\left[1 - (1 + x^{c})^{\lambda}\right]} t^{b-1} (1 - t)^{b-1} dt,$$

(54)
\( x \geq 0 \), where \( \alpha, \lambda, a, b \) are all positive parameters.

**Remark 35.** As pointed out in Remark 33, the cdf \( F(x; \alpha, \beta) = \frac{1}{B(\alpha, \beta)} \int_0^{\theta(x)} t^{\alpha-1} (1 - t)^{\beta-1} dt, \ x \in \mathbb{R} \), where \( Q(x) \) is an absolutely continuous cdf has been introduced before and has been characterized in Hamedani (2016). Letting \( Q(x) = 1 - \exp \{ 1 - (1 + \lambda x)^\theta \} \) in \( F(x; \alpha, \beta) \), we arrive at (54).

55) The cdf of NTPW is given by

\[
F(x; \theta, \beta) = \left( 1 - \exp \left\{ - \left[ e^{x^2} - 1 \right]^2 \right\} \right)^\theta, \ x \geq 0,
\]

where \( \theta, \beta \) are all positive parameters.

**Remark 36.** The cdf \( F(x; \theta, \beta) \) given in (55) has been characterized in Hamedani (2017a) under the name BrX-W.

56) The pdf of GHT is given by

\[
f(x; \alpha, \beta, \theta, \eta) = C_1 e^{a-1} \left( 1 + C_2 x^2 \right)^{-\frac{\alpha}{2} - \frac{1}{2}}, \ x > 0,
\]

where \( \alpha, \beta, \theta, \eta \) are all positive parameters, \( C_1 = \frac{\sqrt{2}\Gamma(\frac{\alpha}{2} + 2\theta)}{\sqrt{2\pi\eta}} \) and \( C_2 = \frac{\beta}{2\sqrt{\pi\eta}} \).

57) The cdf of GE-G is given by

\[
F(x; \alpha, \beta, \tau) = \frac{\beta^2}{\Gamma(\alpha)} \int_0^{\frac{\alpha+x}{\alpha+x}} t^{\alpha-1} e^{-\beta t} dt, \ x \in \mathbb{R},
\]

where \( \alpha, \beta \) are all positive parameters and \( G(x; \tau) \) is the baseline cdf with corresponding pdf \( g(x; \tau) \) depending on the parameter vector \( \tau \).

58) The cdf of MB-F is given by

\[
F(x; a, b, c, d) = \frac{b^d \Gamma\left( \frac{a+c}{2} \right)}{\Gamma(a + c)} \int_0^{\infty} z^{a+c-1} e^{-dz} \text{erf}\left( \sqrt{\frac{z}{2}} \right) \times \text{Erfi}\left( \sqrt{\frac{x}{2}} \right) dz,
\]

for \( x \geq 0 \), and

\[
f(x; a, b, c, d) = C x^{-1/2} \left( \frac{x}{2} + d \right)^{-\frac{a-c}{2} - 1} \text{Erfi}\left( \sqrt{\frac{x}{2}} \right) \times \text{Erfi}\left( \sqrt{\frac{d-b}{2} + d} \right) \times \text{Erfi}\left( \sqrt{\frac{a+c}{2} + d} \right),
\]

and

\[
f(x; a, b, c, d) = C x^{-1/2} \left( \frac{x}{2} + b \right)^{-\frac{a-c}{2} - 1} \text{Erfi}\left( \sqrt{\frac{x}{2}} \right) \times \text{Erfi}\left( \sqrt{\frac{a+c}{2} + b} \right) \times \text{Erfi}\left( \sqrt{\frac{d-b}{2} + b} \right),
\]

for \( x > 0 \), \( \frac{d-b}{2} + d < 1 \) and \( \frac{b-d}{2} + b < 1 \) respectively, where \( a, b, c, d \) are all positive parameters, \( C = \frac{b^d \Gamma(a+c-\frac{1}{2})}{\sqrt{2\pi}(a+c)} \).

We will take up here the more interesting case of \( b = d \). Similar conclusions can be made for the above two cases as well.

The cdf of MB-F, for the case of \( b = d \), is given by

\[
F(x; a, b, c) = \frac{2b^d \Gamma\left( \frac{a+c}{2} \right)}{\Gamma(a + c)} \int_0^{\infty} z^{a+c-1} e^{-dz} \text{erf}\left( \sqrt{\frac{z}{2}} \right) dz,
\]

where \( C_1 = \frac{b^d \Gamma(a+c-\frac{1}{2})}{\sqrt{2\pi}(a+c)} \).

59) The cdf of M-W is given by
\[ F(x; \theta, \eta) = \frac{2}{\sqrt{\pi}} \int_{0}^{\eta} u^{1/2} e^{-u} du, \quad x \geq 0, \quad (59) \]

where \( \theta, \eta \) are positive parameters.

60) The cdf of EWE is given by

\[ F(x; \alpha, \beta, \lambda, a) = \left[ 1 - \exp \left( -a \left( e^{\lambda x} - 1 \right)^{\beta} \right) \right]^{\alpha}, \quad x \geq 0, \quad (60) \]

where \( \alpha, \beta, \lambda, a \) are positive parameters.

**Remark 37.** The cdf \( F(x; \alpha, \beta, \lambda, a) \) given in (60) is a special case of the Exponentiated Weibull Rayleigh (EWR) distribution of Elgarhy. The EWR distribution has been characterized in Hamedani (2017a).

61) The cdf of \( \alpha LT \) are given by

\[ F(x; \alpha) = \begin{cases} 1 - \frac{\log \left( 1 - \alpha (G(x))^{\alpha} \right)}{\alpha G(x)}, & \text{if } \alpha > 0, \alpha \neq 1 \\ G(x), & \text{if } \alpha = 1 \end{cases}, \quad x \in \mathbb{R}, \quad (61) \]

where \( \alpha \) is a parameter and \( G(x) \) is the baseline cdf with pdf \( g(x) \).

62) The cdf of TLOLL is given by

\[ F(x; a, b, \xi) = \left\{ 1 - \left[ 1 - \frac{G(x; \xi)^a}{G(x; \xi)^a + G(x; \xi)^b} \right]^{b} \right\}, \quad x \in \mathbb{R}, \quad (62) \]

where \( a, b \) are positive parameters and \( G(x; \xi) \) is the baseline cdf with pdf \( g(x; \xi) \), which depends on the parameter vector \( \xi \).

**Remark 38.** The cdf \( F(x; a, b, \alpha, \xi) \) given above is similar to the New Family (NF) of distributions of Alizadeh et al. (2015). The cdf of NF distribution is given by

\[ F(x; a, b, \alpha, \xi) = 1 - \left\{ 1 - \frac{G(x; \xi)^a}{G(x; \xi)^a + G(x; \xi)^b} \right\}^{b}, \quad x \in \mathbb{R}, \quad (62) \]

The NF distribution has been characterized in the Research Monograph by Hamedani and Maadooliat (2017).

63) The cdf of \( \text{TW-M} \) is given by

\[ F(x; \theta, \mu) = \frac{2}{\sqrt{\pi}} \int_{0}^{e^{(x-m)^2}} u^{1/2} e^{-u} du, \quad x \geq \mu, \quad (63) \]

where \( \theta > 0 \) and \( \mu \in \mathbb{R} \) are parameters.

64) The cdf of \( \text{GQHR} \) is given by

\[ F(x; a, b, c, d) = \left[ 1 - e^{-\left( a^2 + b^2 + c^2 + d^2 \right)} \right]^d, \quad x \geq 0, \quad (64) \]

where \( a \geq 0, c \geq 0, d > 0 \) and \( b \geq -2 \sqrt{ac} \) are parameters.

**Remark 39.** The cdf \( F(x; a, b, c, d) \) given in (64) is a special case of the Exponentiated Generalized (EG) class of distributions of Cordeiro et al. (2013). The cdf of EG distribution is given by

\[ F(x; \alpha, \beta) = \left[ 1 - \left( 1 - G(x) \right)^{\beta} \right]^{\alpha}, \quad x \in \mathbb{R}, \quad (64) \]

where \( G(x) \) is the baseline distribution. Taking \( \alpha = 1, G(x) = 1 - e^{-\left( a^2 + b^2 + c^2 + d^2 \right)} \), \( x > 0 \), we arrive at (64). The EG distribution has been characterized in Hamedani (2016). The cdf given in (64) is also a special case of the Kumaraswamy
Quadratic Hazard Rate (KQHR) distribution of Elbatal and Aryal (2013). The KQHR has been characterized in Hamedani (2017).

65) The cdf of NFPW is given by

\[ F(x; a, b, \beta, \lambda) = \left[ 1 - e^{(-a x^\beta)} \right]^b \times \left[ 1 + \lambda - \lambda \left( 1 - e^{(-a x^\beta)} \right)^b \right], \quad x \geq 0, \]  

where \( a, b, \beta, \lambda \) are all positive parameters.

**Remark 40.** The cdf given in (65) is a special case of the Kumaraswamy-Tansmuted Exponentiated Modified Weibull (KwTEMW) distributions of Al-babtain et al. (2015). The cdf of KwTEMW distribution is given by

\[ F(x; \alpha, \beta, \theta, a, b, \lambda) = 1 - \left[ 1 - e^{-(\theta x^\gamma)} \right]^a \times \left[ 1 + \lambda - \lambda \left( 1 - e^{-(\theta x^\gamma)} \right)^a \right]^b, \]

\( x \geq 0 \), where \( \alpha, \beta, \theta, a, b, \lambda \) are all positive parameters. Taking \( a = b = 1 \) and \( \theta = 0 \), we arrive at (65). The KwTEMW distribution has been characterized in Hamedani (2018).

66) The cdf of OLBXII is given by

\[ F(x; \alpha, \beta, \sigma, \theta) = 1 - \frac{1 + \theta \left[ 1 + \left( \frac{x}{\sigma} \right)^\beta \right]}{1 + \theta} \exp \left\{ \theta \left[ 1 - \left( \frac{x}{\sigma} \right)^\beta \right] \right\}, \quad x \geq 0, \]  

where \( \alpha, \beta, \sigma, \theta \) are positive parameters.

67) The cdf of DP is given by

\[ F(x; \lambda, \gamma, \beta, \theta) = \frac{1 - \exp \left[ \theta (1 + \lambda x^\gamma)^\beta \right]}{1 - e^{\theta}}, \quad x \geq 0, \]  

where \( \lambda, \gamma, \beta, \theta \) are all positive parameters.

68) The cdf of BXIIMW is given by

\[ F(x; c, k, \alpha, \beta, \lambda) = 1 - \left( 1 + x^k \right)^{-e^{-\alpha x^\beta}}, \quad x \geq 0, \]  

where \( c, k, \alpha, \beta \) all positive and \( \lambda \geq 0 \) are parameters.

69) The cdf of BXP is given by

\[ F(x; \alpha, \beta, \delta) = \left( 1 - \exp \left\{ - \left( \frac{x^\alpha}{\beta} - 1 \right)^{2\delta} \right\} \right)^\delta, \quad x \geq \beta, \]  

where \( \alpha, \beta, \delta \) are positive parameters.

**Remark 41.** The cdf given in (69) is a special case of the Exponentiated Weibull-Pareto (EW-P) distributions of Afify et al. (2016). The cdf of EW-P distribution is given by

\[ F(x; \alpha, \theta, a, b) = \left( 1 - \exp \left\{ - \left[ \left( \frac{x^\gamma}{\beta} - 1 \right)^a \right] \right\} \right)^{\alpha}, \quad x \geq \theta, \]  

where \( \alpha, \theta, a, b \) are positive parameters. Taking \( b = 2 \), we arrive at (69). The EW-P distribution has been characterized in Hamedani and Maadooliat (2017).

70) The cdf of GCFW is given by

\[ F(x; \alpha, \beta, \mu) = 1 - \exp \left\{ - \exp \left[ \mu + \alpha \log H_1(x) + \beta \log H_2(x) \right] \right\}, \]  

where \( \alpha > 0, \beta > 0, \mu \) are parameters, \( H_i(x), i = 1, 2 \) are non-negative and nondecreasing for all \( x \geq 0 \) with \( H_i(0) = 0 \), \( \lim_{x \to \infty} H_i(x) = \infty \) and \( h_i(x) = \frac{d}{dx} H_i(x) \).
71) The cdf of PLP is given by
\[ F(x; \alpha, \beta, \theta, \lambda) = \frac{e^\theta - e^{-\theta[1 - \gamma(x + \gamma)^\delta]}}{e^\theta - 1}, \quad x \geq 0, \] (71)
where \(\alpha, \beta, \theta\) and \(\lambda\) are positive parameters.

**Remark 42.** The cdf given in (71) is a special case of the Truncated Weibull-G (TW-G) distributions of Najarzadegan et al. (2017). The TW-G distribution of Najarzadegan et al. is not new either since this distribution was introduced by Gomes et al. (2015), which is characterized in Hamedani and Maadooliat (2017).

72) The cdf of MWP is given by
\[ F(x; \alpha, \beta, \gamma, \theta) = \frac{\exp\left\{\theta(1 - e^{-\alpha x})\right\}}{e^\theta - 1}, \quad x \geq 0, \] (72)
where \(\alpha, \beta \geq 0, \alpha + \beta > 0, \gamma, \theta > 0\) are parameters.

73) The cdf of EPLG is given by
\[ F(x; \alpha, \beta, \lambda, \theta) = \frac{(1 - \theta)(1 - \left[1 + \frac{1}{\lambda(x)^\gamma}\right] e^{-\lambda x})}{1 - \theta - \left[1 + \frac{1}{\lambda(x)^\gamma}\right] e^{-\lambda x}}, \quad x \geq 0, \] (73)
where \(\alpha, \beta, \lambda, \theta > 0\) are parameters.

74) The cdf of GMWPS is given by
\[ F(x; \alpha, \beta, \gamma, \lambda, \theta) = \frac{C\left(\theta\left(1 - \exp\left\{-\alpha x^\gamma e^{1/(\lambda)}\right\}\right)\right)}{C(\theta)}, \quad x \geq 0, \] (74)
where \(\alpha, \beta, \theta > 0\) and \(\lambda, \gamma \geq 0\) are parameters and \(C(\theta) = \sum_{n=1}^{\infty} a_n \theta^n\), \(a_n\) are nonnegative real numbers.

**Remark 43.** The cdf given in (146) is a special case of the general form of
\[ F(x) = \frac{C(\theta(x)^\gamma)}{C(\theta)}, \quad x \geq 0, \]
mentioned in Tahmasebi and Jafari (2016) in which they set \(t(x) = 1 - \exp\left[\frac{-\beta}{\theta} (x^{\gamma} - 1)\right]\). Taking \(t(x) = \left(1 - \exp\left\{-\alpha x^\gamma e^{1/(\lambda)}\right\}\right)^\beta\) in the above \(F(x)\), yields (74). The distribution of Tahmasebi and Jafari (2016) is characterized in Hamedani and Safavi-Manesh (2017b).

75) The cdf of AMWOLLG (WLOG, for \(\delta = \eta = 1\)) is given by
\[ F(x; \alpha, \beta, \gamma, \lambda) = 1 - \exp\left\{\left(1 - \lambda (\log \Theta(x, \theta))\right)^\beta e^{1/(\log \Theta(x, \theta)) + e^{1/(\log \Theta(x, \theta))}} - e^{-\beta}\right\}, \quad x \in \mathbb{R} \] (75)
where \(\alpha, \beta > 0\) and \(\lambda, \gamma \geq 0\) are parameters.

76) The cdf of EPLPS is given by
\[ F(x; \alpha, \beta, \lambda, \theta) = 1 - \frac{C(\theta - \theta\left[1 - \left(1 + \frac{1}{\lambda(x)^\gamma}\right) e^{-\lambda x}\right]^{\theta})}{C(\theta)}, \quad x \geq 0, \] (76)
where \(\alpha, \beta, \lambda, \theta > 0\) are parameters and \(C(\theta) = \sum_{n=1}^{\infty} a_n \theta^n\), \(a_n\) are nonnegative real numbers.

77) The cdf of W-R is given by
\[ F(x; \gamma, c) = 1 - \exp\left\{-\frac{1}{\gamma^c} \left[-\log (1 - F_R(x))\right]^c\right\}, \quad x \in \mathbb{R}, \] (77)
where \( \gamma, c > 0 \) are parameters and \( F_R(x) \) and \( f_R(x) \) are cdf and pdf of the special distribution taken in Ghosh and Nadarajah (2018).

78) The cdf of WL is given by

\[
F(x, \lambda) = \frac{1}{1 - e^{-\lambda x}} + \frac{2\pi \lambda}{\lambda + 1} \left( 1 - e^{-\lambda x} \right) \left( \frac{e^{-2\pi \lambda}}{(1 - e^{-2\pi \lambda})^2} \right),
\]

where \( 0 \leq x \leq 2\pi \), where \( \lambda > 0 \) is a parameter.

79) The cdf of BW-G is given by

\[
F(x; \alpha, \beta, a, b) = \frac{1}{B(a, b)} \int_0^{1 - \exp\left\{ -a \left( \frac{g(x; \theta)}{\pi \lambda} \right)^\beta \right\}} 1 - \exp\left\{ -a \left( \frac{g(x; \theta)}{\pi \lambda} \right)^\beta \right\} \, dx, \quad x \in \mathbb{R},
\]

where \( \alpha, \beta, a, b \) are positive parameters and \( G(x; \theta) \), \( g(x; \theta) \) are cdf and pdf of the baseline distribution which depends on the parameter vector \( \theta \).

**Remark 44.** The cdf of \( F(x; \alpha, \beta) = \int_0^{e^{a x}} \frac{e^{a x} - 1}{e^{a x}} \frac{1}{e^{a x} - 1} \, dx \), \( x \in \mathbb{R} \), where \( Q(x) \) is an absolutely continuous cdf has been introduced before and has been characterized in Hamedani (2016). Letting \( Q(x) = 1 - \exp\left\{ -a \left( \frac{g(x; \theta)}{\pi \lambda} \right)^\beta \right\} \) in \( F(x; \alpha, \beta) \), we arrive at (79).

80) The cdf of TWR is given by

\[
F(x|\beta, \lambda, \gamma(t)) = 1 - \exp\left\{ -\left( \frac{x}{\gamma(t)} \right)^\beta \right\} \times \left\{ 1 - \lambda + \lambda \exp\left( -1 \times \left( \frac{x}{\gamma(t)} \right)^\beta \right) \right\}, \quad x \geq 0,
\]

where \( \beta > 0, \lambda \) \( (|\lambda| \leq 1) \) are parameters and \( \gamma(t) \) as a parameter depending on a covariate vector \( t = (t_0, t_1, ..., t_p) \) given by \( \gamma(t) = \gamma_0 + \gamma_1 t_1 + ... + \gamma_p t_p \).

2. **Characterizations of Distributions**

We present our characterizations \( (i) - (iv) \) in four subsections.

2.1 **Characterizations Based on Two Truncated Moments**

This subsection deals with the characterizations of distributions listed in Section 1 based on the ratio of two truncated moments. Our first characterization employs a theorem due to Glänzel (1987), see Theorem 1 of Appendix A. The result, however, holds also when the interval \( H \) is not closed, since the condition of the Theorem is on the interior of \( H \).

**Proposition 1.1.** Let \( X : \Omega \rightarrow (0, \infty) \) be a continuous random variable and let \( q_1(x) = \left( 1 - \left( 1 - \beta \left( ax + \frac{b}{2}x^2 \right) \right)^{1/\beta} \right)^{1-\alpha} \)

and \( q_1(x) = q_2(x) \left( 1 - \beta \left( ax + \frac{b}{2}x^2 \right) \right)^{-1} \) for \( x > 0 \). Then for \( \beta < 0 \), the random variable \( X \) has cdf (1) if and only if the function \( \xi \) defined in Theorem 1 is of the form

\[
\xi(x) = (1 - \beta) \left( 1 - \beta \left( ax + \frac{b}{2}x^2 \right) \right), \quad x > 0.
\]

Proof. Suppose the random variable \( X \) has cdf (1), then

\[
(1 - F(x)) E[q_1(X) | X \geq x] = \frac{\alpha}{1 - \beta} \left( 1 - \beta \left( ax + \frac{b}{2}x^2 \right) \right)^{1-\alpha}, \quad x > 0,
\]

and

\[
(1 - F(x)) E[q_2(X) | X \geq x] = \alpha \left( 1 - \beta \left( ax + \frac{b}{2}x^2 \right) \right)^{1/\beta}, \quad x > 0.
\]
Further,

$$\xi(x)q_1(x) - q_2(x) = -\beta q_2(x) > 0 \text{, for } x > 0.$$  

Conversely, if $\xi$ is of the above form, then

$$s'(x) = \frac{\xi'(x)q_1(x)}{\xi(x)q_1(x) - q_2(x)} = \frac{(1 - \beta)(a + bx)}{1 - \beta\left(ax + \frac{b}{2}x^2\right), \text{ } x > 0},$$
and consequently

$$s(x) = -\frac{1 - \beta}{\beta} \log\left(1 - \beta \left(ax + \frac{b}{2}x^2\right)\right), \text{ } x > 0.$$  

Now, according to Theorem 1, $X$ has $cdf (1)$.

**Corollary 1.1.** Let $X : \Omega \to (0, \infty)$ be a continuous random variable and let $q_2(x)$ be as in Proposition 1.1. For $\beta < 0$, the random variable $X$ has $cdf (1)$ if and only if there exist functions $q_1$ and $\xi$ defined in Theorem 1 satisfying the following differential equation

$$\frac{\xi'(x)q_1(x)}{\xi(x)q_1(x) - q_2(x)} = \frac{(1 - \beta)(a + bx)}{1 - \beta\left(ax + \frac{b}{2}x^2\right)}, \text{ } x > 0.$$  

**Remark 1.1.** The general solution of the differential equation in Corollary 1.1 is

$$\xi(x) = \left[1 - \beta\left(ax + \frac{b}{2}x^2\right)\right]^{\frac{1 - \beta}{\beta}} \left[-\int (1 - \beta)(a + bx)\left(1 - \beta\left(ax + \frac{b}{2}x^2\right)\right)^{\frac{1 - \beta}{\beta}} dx + D\right],$$

where $D$ is a constant. We like to point out that one set of functions satisfying the above differential equation is given in Proposition 1.1 with $D = 0$. Clearly, there are other triplets $(q_1, q_2, \xi)$ which satisfy conditions of Theorem 1.

Clearly, a Proposition, a Corollary and a Remark similar to the Proposition 1.1, Corollary 1.1 and Remark 1.1 can be stated for each of the distributions mentioned in the Introduction. For each of these distributions, we give below, the functions $q_1, q_2$ and $\xi$ corresponding to Theorem 1.

2. $q_1(x) = \frac{1 - \beta\left((a + b)x\right)^\frac{1 - \beta}{\beta}}{1 - \beta\left((a + b)x\right)^\frac{1 - \beta}{\beta}}$, $q_2(x) = q_1(x) \left[1 - e^{-\beta(x)}\right]$ and $\xi(x) = \frac{1}{2} \left[1 + \left(1 - e^{-\beta(x)}\right)^\beta\right]$ for $x > 0$.

6. $q_1(x) = \left[1 - \exp\left[-a\left(1 + \eta x)^{-1}\right]\right]^{-\beta}$, $q_2(x) = q_1(x) \exp\left[-a\left(1 + \eta x)^{-1}\right]\right]$ and $\xi(x) = \frac{1}{2} \left[1 + \exp\left[-a\left(1 + \eta x)^{-1}\right]\right]$ for $x > 0$.

7. $q_1(x) \equiv 1$, $q_2(x) = \exp\left((G(x))^\beta\right)$ and $\xi(x) = \frac{1}{2} \left(e + \exp\left((G(x))^\beta\right)\right)$, for $x \in \mathbb{R}$.

10. $q_1(x) = \left[1 - \left(1 + \beta x)^{-\beta}\right]\right]^{-\beta}$, $q_2(x) = q_1(x) \left[1 - (1 + \lambda x)^{-\beta}\right]$ and $\xi(x) = \frac{1}{2} \left[1 + \left(1 + (\lambda x)^{-\beta}\right)^\beta\right]$ for $x > 0$.

12. $q_1(x) = \frac{1 - e^{-\left(\frac{1}{a + b}\right)x}}{\left[1 - e^{-\left(\frac{1}{a + b}\right)x}\right]}$, $q_2(x) = q_1(x) e^{-\beta(x)}$ and $\xi(x) = \frac{1}{2} \left[1 + e^{-\beta(x)}\right]$ for $x > 0$.

14. $q_1(x) \equiv 1$, $q_2(x) = \exp\left[-a\left(\log\left(1 + \left(\frac{x}{a}\right)^\beta\right)\right]\right]$ and $\xi(x) = \frac{1}{2} \exp\left[-a\left(\log\left(1 + \left(\frac{x}{a}\right)^\beta\right)\right]\right]$ for $x > 0$.

18. $q_1(x) = \frac{1 - (1 - e^{-\left(\frac{x}{a}\right)\beta})^{-1}}{1 - (1 - e^{-\left(\frac{x}{a}\right)\beta})^{-1}}$, $q_2(x) = q_1(x) e^{-\beta(x)}$ and $\xi(x) = \frac{1}{2} e^{-\beta(x)}$ for $x > 0$. 
19. $q_1 (x) = \left[ 1 - \left( \frac{\lambda}{\mu} \right)^{\alpha} \left[ 1 + \lambda \left( \frac{\mu}{\lambda} \right)^{\alpha} \right] \right]^{1-b}$, $q_2 (x) = q_1 (x) \left[ \left[ 1 - \left( \frac{\lambda}{\mu} \right)^{\alpha} \right] \left[ 1 + \lambda \left( \frac{\mu}{\lambda} \right)^{\alpha} \right] \right]^a$ and 
\[ \xi (x) = \frac{1}{\beta} \left[ 1 + \left( \frac{\lambda}{\mu} \right)^{\alpha} \right] \] for $x > 0.$

21. $q_1 (x) = x^{1-\alpha} \left[ \delta - (\delta - 1) (\frac{x}{\eta})^\alpha \right]^{\alpha}$, $q_2 (x) = q_1 (x) (x+\beta)^{-1}$ and $\xi (x) = \frac{\mu x}{\alpha^2} (x + \beta)^{-1}$ for $x > 0.$

23. $q_1 (x) = (1 + x)^{-1}$, $q_2 (x) = q_1 (x) e^{t_{\lambda-x^{-\alpha}}} \quad \text{and} \quad \xi (x) = \frac{1}{\beta} \left( 1 + e^{-t_{\lambda-x^{-\alpha}}} \right)$ for $0 < x < \eta.$

24. $q_1 (x) = \left[ 1 - \gamma + 2x \left( 1 - e^{\left( -\frac{x}{\eta} \right)^\alpha} \right) \right]^{1-\alpha}$, $q_2 (x) = q_1 (x) \left( 1 - e^{\left( -\frac{x}{\eta} \right)^\alpha} \right)$ and $\xi (x) = \frac{\gamma}{\alpha^2} \left( 1 - e^{-\left( -\frac{x}{\eta} \right)^\alpha} \right)$ for $x > 0.$

28. $q_1 (x) = e^{-\left( \frac{\alpha}{\beta} \right)} \left[ 1 - e^{-\left( \frac{x}{\eta} \right)^\alpha} \right]^{1-\alpha}$, $q_2 (x) = q_1 (x) \left( 1 - e^{\left( -\frac{x}{\eta} \right)^\alpha} \right)$ and $\xi (x) = \frac{\gamma}{\alpha^2} e^{-x^{\alpha}}$ for $x > 0.$

30. $q_1 (x) = \left[ 1 - \exp \left( \left( (1 + x^\alpha)^{-\beta} - 1 \right) \right) \right]^{1-\alpha}$, $q_2 (x) = q_1 (x) \exp \left( \left( (1 + x^\alpha)^{-\beta} - 1 \right) \right)$ and $\xi (x) = \frac{1}{\beta} \left[ \exp \left( \left( (1 + x^\alpha)^{-\beta} - 1 \right) \right) + 1 \right]$ for $x > 0.$

38. $q_1 (x) = \left[ 1 - \left( \frac{x}{\mu} \right)^{\alpha} \right]^{\alpha}$, $q_2 (x) = q_1 (x) \left( \frac{x}{\mu} \right)^{\alpha}$ and $\xi (x) = \frac{1}{\beta} \left[ 1 + \left( \frac{x}{\mu} \right)^{\alpha} \right]$ for $0 < x < \lambda.$

42. $q_1 (x) = \left( \frac{x}{\mu} \right)^{\alpha} \left[ (1 - \beta \Gamma (\omega + 1) - 2 \beta \Gamma (\omega + 1, \lambda x) \right]^{1-\alpha}$, $q_2 (x) = \lambda x q_1 (x)$ and $\xi (x) = x + \frac{\lambda}{\alpha}$ for $x > x_0.$

43. $q_1 (x) = \left[ 1 - \lambda + 2 \frac{\omega}{\lambda} \left( \frac{\mu}{\lambda} \right)^{\alpha} \right]^{1-\alpha}$, $q_2 (x) = \left( \frac{\omega}{\lambda} \right)^{\alpha} \left[ 1 - \lambda + \lambda \left( \frac{\mu}{\lambda} \right)^{\alpha} \right]^{1-\alpha}$, $q_2 (x) = q_1 (x) \left[ 1 - \left( \frac{\omega}{\lambda} \right)^{\alpha} \right]$ and $\xi (x) = \frac{1}{\beta^2} \left[ 1 + \left( \frac{\omega}{\lambda} \right)^{\alpha} \right]$ for $x > x_0.$

47. $q_1 (x) = \left[ 1 - \left( 1 - (1 + x^\alpha)^{-\beta} - 1 \right) \right]^{1-\alpha}$, $q_2 (x) = q_1 (x) \left( 1 - e^{\left( -\frac{x}{\eta} \right)^\alpha} \right)$ and $\xi (x) = \frac{1}{\beta} \left( 1 - e^{-\left( -\frac{x}{\eta} \right)^\alpha} \right)$ for $x > 0.$

57. $q_1 (x) = (1 + \alpha x) e^{-\left( 1 + x^\alpha \right)^{-\beta} \left( 1 + \alpha x \right)^{-\beta}}$, $q_2 (x) = q_1 (x) (1 + x^\alpha)^{-\beta} \left( 1 + \alpha x \right)^{-\beta}$ and $\xi (x) = \frac{2 + \alpha x}{\alpha^2} \left( 1 + \alpha x \right)^{-\beta}$ for $x > 0.$

58. $q_1 (x) = (1 + \alpha x) e^{-\left( 1 + x^\alpha \right)^{-\beta} \left( 1 + \alpha x \right)^{-\beta}}$, $q_2 (x) = q_1 (x) (1 + x^\alpha)^{-\beta} \left( 1 + \alpha x \right)^{-\beta}$ and $\xi (x) = \frac{2 + \alpha x}{\alpha^2} \left( 1 + \alpha x \right)^{-\beta}$ for $x > 0.$

60. $q_1 (x) = \left[ (\alpha - (\alpha - 1) G (x) \right]$, $q_2 (x) = q_1 (x) G (x)$ and $\xi (x) = \frac{1}{2} \left[ 1 + G (x) \right]$ for $x > 0.$

62. $q_1 (x) = (x - \mu)^{-1}$, $q_2 (x) = q_1 (x) e^{-t_{\lambda-x^{-\alpha}}} \quad \text{and} \quad \xi (x) = \frac{1}{\beta} e^{-t_{\lambda-x^{-\alpha}}}$ for $x > \mu.$

65. $q_1 (x) = \exp \left( \theta \left( 1 - \left[ 1 + \left( \frac{x}{\eta} \right)^{\alpha} \right]^{\alpha} \right) \right)$ and $\xi (x) = \frac{1}{\beta} \exp \left( \theta \left( 1 - \left[ 1 + \left( \frac{x}{\eta} \right)^{\alpha} \right]^{\alpha} \right) \right)$ for $x > 0.$

66. $q_1 (x) = \exp \left( -\theta \left[ 1 + \lambda x^{-\gamma} \right]^{\beta} \right)$, $q_2 (x) = q_1 (x) \left[ 1 + \lambda x^{-\gamma} \right]^{\beta}$ and $\xi (x) = \frac{1}{\beta} \left[ 1 + \left( 1 + \lambda x^{-\gamma} \right)^{\beta} \right]$ for $x > 0.$

67. $q_1 (x) = \exp \left( -\theta \left( 1 - e^{-\left( -\frac{x}{\eta} \right)^\alpha} \right)^{\alpha} \right)$, $q_2 (x) = q_1 (x) e^{-\left( -\frac{x}{\eta} \right)^\alpha}$ and $\xi (x) = \frac{1}{\beta} \exp \left( -\theta \left( 1 - e^{-\left( -\frac{x}{\eta} \right)^\alpha} \right)^{\alpha} \right)$ for $x > 0.$

71. $q_1 (x) = \exp \left( -\theta \left( 1 - e^{-\left( -\frac{x}{\eta} \right)^\alpha} \right)^{\alpha} \right)$, $q_2 (x) = q_1 (x) e^{-\left( -\frac{x}{\eta} \right)^\alpha}$ and $\xi (x) = \frac{1}{\beta} e^{-\left( -\frac{x}{\eta} \right)^\alpha}$ for $x > 0.$

72. $q_1 (x) = \left( 1 - \theta \left[ 1 - \left( \frac{x}{\eta} \right)^{\alpha} \right]^{\alpha} \right)$, $q_2 (x) = q_1 (x) e^{-t_{\lambda-x^{-\alpha}}} \quad \text{and} \quad \xi (x) = \frac{1}{\beta} \left( 1 - \left( \frac{x}{\eta} \right)^{\alpha} \right) e^{-t_{\lambda-x^{-\alpha}}}$ for $x > 0.$
74. $q_1(x) = \left(\frac{1}{e(x)}\right) \left(\frac{\alpha e^{-\left(\log G(x; \Theta)\right)} \left(\log G(x; \Theta)\right) + 1}{\lambda e^{-\left(\log G(x; \Theta)\right)} - \beta}\right)\times \exp\left(-\left(\alpha \left(-\log G(x; \Theta)\right) + e^{\left(-\log G(x; \Theta)\right)} - e^{\theta}\right)\right)^{-1}$, $q_2(x) = q_1(x) F(x; \Theta)$ and $x = \begin{cases} 1 + G(x; \Theta) & \text{for } x > 0. \\ 0 & \text{otherwise.} \end{cases}$

75. $q_1(x) = \left(\frac{C \left(\log (1 - F_R(x))\right)}{\lambda} - \beta\right) \left(1 - \left(1 + \frac{d^2}{d^2} e^{-\lambda x}\right)^{-1}\right)$, $q_2(x) = q_1(x) \left(1 - \left(1 + \frac{d^2}{d^2} e^{-\lambda x}\right)^{-1}\right)$ and $\xi(x) = \frac{1}{2} \left(1 + \left(\frac{\lambda}{\lambda + 1}\right) e^{-\lambda x}\right)$ for $x > 0$.

76. $q_1(x) = \left(\frac{1 - \frac{\beta}{\gamma}}{\gamma}\right)$ and $\xi(x) = \frac{1}{2} \left(\frac{\lambda}{\lambda + 1}\right) e^{-\lambda x}$ for $x \in (0, 2\pi)$.

77. $q_1(x) = \left(1 - x + 2\alpha\pi\right)^{-1}$, $q_2(x) = q_1(x) \exp\left(-\left(\frac{\alpha}{\gamma}\right)^{\beta}\right)$ and $\xi(x) = \frac{1}{2} \left(\frac{\lambda}{\lambda + 1}\right) e^{-\lambda x}$ for $x > 0$.

2.2 Characterization in Terms of Hazard Function

The hazard function, $h_F$, of a twice differentiable distribution function, $F$, satisfies the following first order differential equation $\frac{f(x)}{\vartheta^2 + f(x)} = \frac{h_F(x)}{\vartheta^2}$, which should be mentioned that for many univariate continuous distributions, the above equation is the only differential equation available in terms of the hazard function. In this subsection we present non-trivial characterizations of EL (for $k = 1$), ETWU (for $\lambda = 0$), KumeG (for $a = 1$), TWF (for $\lambda = 0$), GWXII, WBN, KM, MBI, GT, MDF (for $a = 1$), TIL (for $a = 0$), K-PF, GBG, WW, NLM, ATL, GRL, BGM, GSC, MFW, AMPW, EPL, WS, G and TWR distributions in terms of the hazard function, which are not of the above trivial form.

Proposition 2.1. Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has cdf (1) for $k = 1$ if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) - \frac{\vartheta^2}{\vartheta^2 + f(x)} h_F(x) = -\frac{\vartheta^3 (x + 1) + (1 + \vartheta)}{\vartheta^2 (x + 1) + (1 + \vartheta)^3}, \quad x > 0.$$

Proof. If $X$ has cdf (1) for $k = 1$, then clearly the above differential equation holds. If the differential equation holds, then

$$\frac{d}{dx} \left(\vartheta^2 (x + 1) + (1 + \vartheta)\right)^{-1} h_F(x) = -\frac{\vartheta^3 (1 + \vartheta)}{\left(\vartheta^2 (x + 1) + (1 + \vartheta)^3\right)^2},$$

from which we arrive at the hazard function corresponding to the cdf (1).

A Proposition similar to that of Proposition 2.1 will be stated (without proof) for each one of the distributions listed in subsection 2.1.

Proposition 2.2. Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has cdf (2) for $\lambda = 0$, if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) + \frac{\beta \vartheta^{\beta - 1}}{\vartheta^\beta} h_F(x) = \frac{\alpha\beta}{\sigma} e^{-(\frac{x}{\sigma})^\beta} \frac{d}{dx} \left(\frac{1}{1 - e^{-\left(\frac{x}{\sigma}\right)^\beta}} \right), \quad x > 0.$$

Proposition 2.3. Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has cdf (6), if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) - a (1 + \eta x)^{-\left(\frac{1}{\eta} + 1\right)} h_F(x) = ab \exp\left\{-a (1 + \eta x)^{-\left(\frac{1}{\eta} + 1\right)}\right\} \frac{d}{dx} \left(\frac{(1 + \eta x)^{-\left(\frac{1}{\eta} + 1\right)}}{1 - \exp\left(-a (1 + \eta x)^{-\left(\frac{1}{\eta} + 1\right)}\right)}\right), \quad x > 0.$$

53
**Proposition 2.4.** Let $X : \Omega \rightarrow \mathbb{R}$ be a continuous random variable. The random variable $X$ has \textit{cdf} (7), if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) - \alpha g(x)(G(x))^{\alpha-1} h_F(x) = \alpha \exp\{(G(x))^{\alpha}\} \frac{d}{dx} \left\{ \frac{g(x)(G(x))^{\alpha-1}}{e - \exp\{(G(x))^{\alpha}\}} \right\}, \ x \in \mathbb{R}.$$ 

**Proposition 2.5.** Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has \textit{cdf} (10), for $\alpha = 1$, if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) + \lambda (1 + \lambda x)^{-1} h_F(x) = \frac{-p x^2 x^2}{1 - p (1 + \lambda x)(1 - \lambda x)} , \ x > 0.$$ 

**Proposition 2.6.** Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has \textit{cdf} (12), for $\lambda = 0$, if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) - b \beta x^{-(\beta+1)} h_F(x) = b \beta x^{-(\beta)} x^{\beta+1} \frac{d}{dx} \left\{ \frac{x^{-(\beta+1)}}{1 - e^{-x^{\beta+1}}} \right\}, \ x > 0.$$ 

**Proposition 2.7.** Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has \textit{cdf} (14), if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) - (u - 1) x^{-1} h_F(x) = a \beta x^{u-1} \frac{d}{dx} \left\{ \log\left( 1 + \left( \frac{x}{x} \right)^u \right) \right\}, \ x > 0.$$ 

**Proposition 2.8.** Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has \textit{cdf} (18), if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) + 2\alpha x h_F(x) = 2a \beta x^2 \theta e^{-(\lambda x)^2} \frac{d}{dx} \left\{ x \left( 1 - e^{-(\lambda x)^2} \right)^{\beta-1} \right\}, \ x > 0.$$ 

**Proposition 2.9.** Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has \textit{pdf} (38), if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) = \frac{\alpha + 1}{x} h_F(x) = a \beta x^{\alpha-1} \frac{d}{dx} \left\{ \frac{1 - \lambda + 2 \lambda \left( \frac{x}{x} \right)^u \left[ \left( \frac{x}{x} \right)^u \right] \left[ 1 + \lambda \left( \frac{x}{x} \right)^u \right]^{\alpha-1}}{1 - \left( \frac{x}{x} \right)^u \left[ 1 + \lambda \left( \frac{x}{x} \right)^u \right]^{\alpha-1}} \right\}, \ x > 0.$$ 

**Proposition 2.10.** Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has \textit{cdf} (21), if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) - \frac{\alpha - 1}{x + \beta} h_F(x) = a \beta x^{\beta-1} \frac{d}{dx} \left\{ \frac{x^{\beta-1}}{(x + \beta)^{\beta} - x^\beta} \delta(x + \beta)^{\beta} - (\delta - 1) x^\beta \right\}, \ x > 0.$$ 

**Proposition 2.11.** Let $X : \Omega \rightarrow (0, \eta)$ be a continuous random variable. The random variable $X$ has \textit{pdf} (46), if and only if its hazard function $h_F(x)$ satisfies the following differential equation

$$h'_F(x) + \theta h_F(x) = \frac{\theta^2}{(1 + \theta)^2} \left\{ \frac{1 + \theta + \theta \left( 1 + \theta \right)^2 e^{-\theta x} - (1 + \theta + \theta \eta) e^{-\theta \eta}}{(1 + \theta + \theta x) e^{-\theta x} - (1 + \theta + \theta \eta) e^{-\theta \eta}} \right\}, \ 0 < x < \eta.$$
Proposition 2.12. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (24), for $\lambda = 0$, if and only if its hazard function $h_{F}(x)$ satisfies the following differential equation

$$h'_{F}(x) - \beta \theta^{2} x^{-(\beta + 1)} h_{F}(x) = \alpha \beta \theta^{2} e^{-(\frac{1}{\theta})} \left\{ x^{-(\beta + 2)} \left[ \left( \beta + 1 - \beta \theta x \right) e^{-(\frac{1}{\theta})} \left( \beta + 1 \right) \right] \right\}, \quad x > 0.$$ 

Proposition 2.13. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (30), for $\alpha = 1$, if and only if its hazard function $h_{F}(x)$ satisfies the following differential equation

$$h'_{F}(x) - \frac{\alpha - 1}{x} h_{F}(x) = -\alpha a^{2} \beta \lambda x^{-2(\alpha - 1)} (1 + x^{\alpha})^{-\beta - 2} + \alpha a \beta e^{-1} x^{-\alpha - 1} \left\{ \frac{1}{\exp \left( (1 + x^{\alpha})^{-\beta - 1} \right) - e^{-1}} \right\}, \quad x > 0.$$ 

Proposition 2.14. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (34), for $\lambda = 0$, if and only if its hazard function $h_{F}(x)$ satisfies the following differential equation

$$h'_{F}(x) - \frac{\alpha \theta - 1}{x} h_{F}(x) = \frac{\alpha^{2} \beta \theta^{2}}{\lambda} \left( \frac{x}{\lambda} \right)^{2(\alpha - 1)} \left[ 1 - \left( \frac{x}{\lambda} \right) \right]^{-2} \left( \frac{1 + x^{\alpha}}{\log \left( \frac{1}{(1 + x^{\alpha})^{-\beta - 1}} \right) - e^{-1}} \right), \quad 0 < x < \lambda.$$ 

Proposition 2.15. Let $X : \Omega \to (0, \lambda)$ be a continuous random variable. The random variable $X$ has $cdf$ (44), if and only if its hazard function $h_{F}(x)$ satisfies the following differential equation

$$h'_{F}(x) - \frac{g'(x; \eta)}{g(x; \eta)} h_{F}(x) = c k g(x; \eta) \left\{ \log \left( \log \left( \frac{G(x; \eta)}{G(x; \eta)} \right) \right) \right\}, \quad x \in \mathbb{R}.$$ 

Proposition 2.17. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (50), if and only if its hazard function $h_{F}(x)$ satisfies the following differential equation

$$h'_{F}(x) - \frac{\gamma - 1}{x} h_{F}(x) = a \beta (\beta - 1) \lambda^{2} \gamma^{2} x^{2(\gamma - 1)} e^{(\gamma - 1) x^{\gamma}} \left[ e^{x^{\gamma}} - 1 \right]^{\beta - 2}, \quad x > 0.$$ 

Proposition 2.18. Let $X : \Omega \to (0, 1)$ be a continuous random variable. The random variable $X$ has $pdf$ (104), if and only if its hazard function $h_{F}(x)$ satisfies the following differential equation

$$h'_{F}(x) - \frac{\alpha - 1}{x} h_{F}(x) = 0, \quad 0 < x < 1.$$ 

Proposition 2.19. Let $X : \Omega \to \mathbb{R}$ be a continuous random variable. The random variable $X$ has $cdf$ (60), if and only if its hazard function $h_{F}(x)$ satisfies the following differential equation

$$h'_{F}(x) - \frac{g'(x)}{g(x)} h_{F}(x) = (\alpha - 1) g(x) \left\{ \frac{\alpha - (\alpha - 1) G(x)}{\log \left( \alpha - (\alpha - 1) G(x) \right)} \right\} x \in \mathbb{R}.$$ 

Proposition 2.20. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (65), if and only if its hazard function $h_{F}(x)$ satisfies the following differential equation

$$h'_{F}(x) - \frac{\alpha - 1}{x} h_{F}(x) = \theta^{2} \alpha \beta \theta^{2} e^{-1} \frac{d}{dx} \left\{ \left[ 1 + \left( \frac{x}{\theta} \right)^{\alpha} \right]^{\beta - 1} \right\}, \quad x > 0.$$
Proposition 2.21. Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (67) if and only if its hazard function $h_F(x)$ satisfies the differential equation

$$h_F'(x) + \frac{c x^{\alpha-1}}{1 + x^c} h_F(x) = (1 + x^c)^{-1} \frac{d}{dx} \left[ k c x^{\alpha-1} + (1 + x^c) \alpha e^{\alpha x} x^{\beta-1} (\beta + \lambda x) \right], \quad x > 0.$$ 

Proposition 2.22. Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (69) if and only if its hazard function $h_F(x)$ satisfies the differential equation

$$h_F'(x) - \left( \frac{h_1(x)}{H_1(x)} + \beta \frac{h_2(x)}{H_2(x)} \right) h_F(x) = \exp \left[ \mu + \alpha \log H_1(x) + \beta \log H_2(x) \right] \frac{d}{dx} \left( \frac{\alpha h_1(x)}{H_1(x)} + \beta \frac{h_2(x)}{H_2(x)} \right), \quad x > 0.$$ 

Proposition 2.23. Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (71) if and only if its hazard function $h_F(x)$ satisfies the differential equation

$$h_F'(x) + \left( \alpha + \beta y \gamma^{-1} \right) h_F(x) = \theta e^{-\alpha x} \beta \frac{d}{dx} \left( \frac{\alpha x + \beta y \gamma^{-1}}{\exp (\theta e^{-\alpha x} \beta)} - 1 \right), \quad x > 0.$$ 

Proposition 2.24. Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (74) if and only if its hazard function $h_F(x)$ satisfies the differential equation

$$h_F'(x) - \frac{g'(x; \Theta)}{g(x; \Theta)} h_F(x) = \alpha g(x; \Theta) \times \frac{d}{dx} \left[ \frac{ae^{\left( -\log G(x; \Theta) \right)} \left( \gamma \left( -\log \bar{G}(x; \Theta) \right) + 1 \right) + \lambda e^{\left( -\log G(x; \Theta) \right)} - \beta}{\bar{G}(x; \Theta)} \right], \quad x > 0.$$ 

Proposition 2.25. Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (75) if and only if its hazard function $h_F(x)$ satisfies the differential equation

$$h_F'(x) + \lambda \beta \lambda^{\beta-1} \left( x^\beta \right)^{-1} h_F(x) = \alpha \beta \lambda^\beta \left( x^\beta \right)^{-1} x \left[ 1 - \left( 1 + \frac{\beta x}{\lambda} \right) e^{-\beta x} \right]^{\alpha-1} C' \left( \theta - \theta \left[ 1 - \left( 1 + \frac{\beta x}{\lambda} \right) e^{-\beta x} \right]^{\alpha} \right), \quad x > 0.$$ 

Proposition 2.26. Let $X : \Omega \rightarrow \mathbb{R}$ be a continuous random variable. The random variable $X$ has $cdf$ (76) if and only if its hazard function $h_F(x)$ satisfies the differential equation

$$h_F'(x) - \frac{f_F'(x)}{f_F(x)} h_F(x) = \frac{c}{\gamma} \frac{d}{dx} \left[ \frac{\left[ -\log (1 - F_R(x)) \right]^\gamma - 1}{1 - F_R(x)} \right], \quad x \in \mathbb{R}.$$ 

Proposition 2.27. Let $X : \Omega \rightarrow (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (79) if and only if its hazard function $h_F(x)$ satisfies the differential equation

$$h_F'(x) - \frac{\beta - 1}{\lambda} h_F(x) = \frac{\beta x^{\beta-1}}{(x^\beta)^{\beta}} \frac{d}{dx} \left[ \frac{1 - \lambda + 2\lambda \exp \left( \frac{-x}{\lambda} \right)^\beta}{1 - \lambda + \lambda \exp \left( \frac{-x}{\lambda} \right)^\beta} \right], \quad x > 0.$$ 

2.3 Characterization in Terms of the Reverse (or Reversed) Hazard Function

The reverse hazard function, $r_F$, of a twice differentiable distribution function, $F$, is defined as $r_F(x) = \frac{f(x)}{1 - F(x)}$, $x \in \text{support of } F$. In this subsection we present characterizations of ETWG (for $\lambda = 0$), GEG, ELG (for $\alpha = 1$), KwTP (for $b = 1$), MOEIP, SST, GBXIIP, OLBXII, MWP, EPLG distributions in terms of the reverse hazard function.
Proposition 3.1. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has pdf (4) (for $\lambda = 0$) if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) + \frac{\beta x^{\beta-1}}{\sigma^\beta} r_F(x) = \frac{\alpha \beta (1 - p)}{\sigma} e^{-\left(\frac{x}{\sigma}\right)} \frac{d}{dx} \left\{ \left(1 - e^{-\left(\frac{x}{\sigma}\right)}\right)^{\beta-1} \left[1 - p + p \left(1 - e^{-\left(\frac{x}{\sigma}\right)}\right)^\alpha \right] \right\}, \quad x > 0.$$  

Proof. If $X$ has pdf (4) for $\lambda = 0$, then clearly the above differential equation holds. If the differential equation holds, then

$$\frac{d}{dx} \left\{ e^{\left(\frac{x}{\sigma}\right)} r_F(x) \right\} = \frac{\alpha \beta (1 - p)}{\sigma} \frac{d}{dx} \left\{ \left(1 - e^{\left(\frac{x}{\sigma}\right)}\right)^{\beta-1} \left[1 - p + p \left(1 - e^{\left(\frac{x}{\sigma}\right)}\right)^\alpha \right] \right\},$$

from which we arrive at the hazard function corresponding to the cdf (2).

A Proposition similar to that of Proposition 3.1 will be stated (without proof) for each one of the distributions listed in subsection 3.1.

Proposition 3.2. Let $X : \Omega \to \mathbb{R}$ be a continuous random variable. The random variable $X$ has cdf (7) if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) - \alpha g(x) (G(x))^{\alpha-1} r_F(x) = \alpha \exp \left( (G(x))^\alpha \right) \frac{d}{dx} \left\{ \frac{g(x)(G(x))^{\alpha-1}}{\exp((G(x))^\alpha) - 1} \right\}, \quad x \in \mathbb{R}.$$  

Proposition 3.3. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has pdf (20), for $\alpha = 1$, if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) + \lambda (1 + \lambda x)^{-1} r_F(x) = (1 - p) \lambda \theta (1 + \lambda x)^{-(\theta+1)} \frac{d}{dx} \left\{ \frac{1 - (1 + \lambda x)^{-\theta}}{1 - p (1 + \lambda x)^{-\theta}} \right\}, \quad x > 0.$$  

Proposition 3.4. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has cdf (19), for $b = 1$, if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) + \frac{\alpha + 1}{x} r_F(x) = ab \alpha^\theta x^{-\alpha(a+1)} \frac{d}{dx} \left\{ \frac{1 - \lambda + 2 \lambda \left(\frac{x}{\alpha}\right)^\alpha}{1 - \left(\frac{x}{\alpha}\right)^\alpha} \frac{1}{\left(\frac{x}{\alpha}\right)^\alpha} \right\}, \quad x > 0.$$  

Proposition 3.5. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has cdf (21), if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) - \frac{\alpha - 1}{x + \beta} r_F(x) = \alpha \beta \delta (x + \beta)^{\alpha-1} \frac{d}{dx} \left\{ \frac{1}{x + \beta} \frac{1}{(x + \beta)^\alpha - (\delta - 1) x^\alpha} \right\}, \quad x > 0.$$  

Proposition 3.6. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has cdf (29), if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) + \theta r_F(x) = -\frac{\pi}{2} \theta^2 e^{-2\theta x} \left[ 1 + \tan^2 \left( \frac{\pi}{2} e^{-\theta x} \right) \right], \quad x > 0.$$  

Proposition 3.7. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has cdf (30), if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) - \frac{\alpha - 1}{x} r_F(x) = \alpha^2 \alpha \beta (\beta + 1) \lambda x^{2\alpha-1} (1 + x^\alpha)^{\beta-2} + a \alpha \lambda (1 + x^\alpha)^{\alpha-1} \frac{d}{dx} \left\{ \frac{(1 + x^\alpha)^{\beta-1}}{1 - \exp \left( \lambda (1 + x^\alpha)^{\beta - 1} \right)} \right\}, \quad x > 0.$$  

57
Proposition 3.8. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (65), if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) - \frac{\alpha - 1}{x} r_F(x) = \theta \alpha \beta e^{\alpha x^\theta} x^{\alpha - 1} \left\{ \frac{1 + \left( \frac{z}{\beta} \right) e^{\alpha x^\theta}}{1 + \theta \left( \frac{z}{\beta} \right) e^{\alpha x^\theta}} \right\}, \quad x > 0.$$ 

Proposition 3.9. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (71), if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) + (\alpha + \beta x^{-\beta}) r_F(x) = \theta e^{-\alpha x^{-\beta} x} \left\{ \frac{\alpha x + \beta y x^{-\beta}}{1 - \exp \left( -\theta \left[ 1 - e^{-\alpha x^{-\beta} x} \right] \right)} \right\}, \quad x > 0.$$ 

Proposition 3.10. Let $X : \Omega \to (0, \infty)$ be a continuous random variable. The random variable $X$ has $cdf$ (72), if and only if its reverse hazard function $r_F(x)$ satisfies the following differential equation

$$r_F'(x) + \lambda \beta x^{\beta-1} r_F(x) = \frac{\alpha \beta \lambda^2}{\lambda + 1} e^{-\lambda x^\beta} \frac{d}{dx} \left\{ \frac{x^{\beta - 1} \left[ 1 + \lambda \left( \frac{z}{\beta} \right) e^{-\lambda x^\beta} \right] e^{-\lambda x^\beta}}{\lambda + \theta \left[ 1 - \lambda \left( \frac{z}{\beta} \right) e^{-\lambda x^\beta} \right] e^{-\lambda x^\beta}} \right\}, \quad x > 0.$$ 

2.4 Characterization Based on the Conditional Expectation of Certain Function of the Random Variable

In this subsection we employ a single function $\psi$ (or $\psi_1$) of $X$ and characterize the distribution of $X$ in terms of the truncated moment of $\psi(X)$ (or $\psi_1(X)$). The following propositions have already appeared in Hamedani’s previous work (2013), so we will just state them here which can be used to characterize some of the distributions listed in Section 1.

Proposition H1. Let $X : \Omega \to (e, f)$ be a continuous random variable with $cdf$ $F$. Let $\psi(x)$ be a differentiable function on $(e, f)$ with $\lim_{x \to e^+} \psi(x) = 1$. Then for $\delta \neq 1$,

$$E \left[ \psi(X) \mid X \geq x \right] = \delta \psi(x), \quad x \in (e, f),$$

if and only if

$$\psi(x) = (1 - F(x))^{\frac{1}{\delta - 1}}, \quad x \in (e, f).$$

Proposition H2. Let $X : \Omega \to (e, f)$ be a continuous random variable with $cdf$ $F$. Let $\psi_1(x)$ be a differentiable function on $(e, f)$ with $\lim_{x \to e^-} \psi_1(x) = 1$. Then for $\delta_1 \neq 1$,

$$E \left[ \psi_1(X) \mid X \leq x \right] = \delta_1 \psi_1(x), \quad x \in (e, f),$$

implies

$$\psi_1(x) = (F(x))^{\frac{1}{\delta_1 - 1}}, \quad x \in (e, f).$$

Remarks 4.1. (A) For $(e, f) = (0, \infty)$, $\psi(x) = 1 - \exp \left\{ -\alpha \left( 1 + \eta e^{\alpha} \right)^{-1/\theta} \right\}$ and $\delta = \frac{\alpha}{1 + \theta}$, Proposition H1 provides a characterization of KumGEV distribution. (B) For $(e, f) = (0, \infty)$, $\psi(x) = \exp \left\{ -\left( \log \left( 1 + \left( \frac{z}{\eta} \right)^{\theta/\alpha} \right) \right)^{1/\theta} \right\}$ and $\delta = \frac{\alpha}{1 + \theta}$, Proposition H1 provides a characterization of GWBXII distribution. (C) For $(e, f) = (0, \infty)$, $\psi(x) = 1 - \left[ 1 - \left( \frac{z}{\eta} \right)^{\alpha/\theta} \right]^{1/\theta}$ and $\delta = \frac{\alpha}{1 + \theta}$, Proposition H1 provides a characterization of KBTP distribution. (D) For $(e, f) = (0, \infty)$, $\lambda = 0$, $\psi(x) = \left( 1 - e^{-\left( \frac{z}{\eta} \right)^{\theta/\alpha}} \right)$ and $\delta = \frac{\alpha}{1 + \theta}$, Proposition H1 provides a characterization of TEF distribution. (E) For $(e, f) = (0, \infty)$, $\lambda = 0$, $\psi(x) = \left( 1 - \exp \left( \frac{1}{\left( 1 + \left( \frac{z}{\eta} \right)^{\theta/\alpha} \right)^{1/\theta}} \right) \right)$ and $\delta = \frac{\alpha}{1 + \theta}$, Proposition H2 provides a characterization of GBXIIIP distribution. (F) For $(e, f) = (0, \infty)$, $\psi(x) = \left( \frac{1}{1 + \left( \frac{z}{\eta} \right)^{\theta/\alpha}} \right)$ and $\delta = \frac{\alpha}{1 + \theta}$, Proposition H1 provides a characterization of TLL distribution. (H) For $(e, f) = (0, \lambda)$, $\psi(x) = \left( 1 - \left( \frac{z}{\eta} \right)^{\alpha/\theta} \right)$ and $\delta = \frac{\alpha}{1 + \theta}$, Proposition H1
provides a characterization of Kw-PF distribution. (I) For \((e, f) = \mathbb{R}, \psi(x) = \left(1 + \left(-\log\left(G(x; \eta)\right)\right)^\delta\right)^{-1}\) and \(\delta = \frac{k}{1 + \theta}\), Proposition H1 provides a characterization of GBG distribution. (J) For \((e, f) = (0, \infty), \psi(x) = \exp\left\{-\left[e^{x\nu} - 1\right]^\beta\right\}\) and \(\delta = \frac{1}{1 + \theta}\), Proposition H1 provides a characterization of OLBXII \((\theta, \psi)\) distribution. (K) For \((e, f) = (0, 1), \psi(x) = e^{x^\beta}\) and \(\delta = \frac{1}{1 + \theta}\), Proposition H1 provides a characterization of BXIIIMW \((\theta, \psi)\) distribution. \(\psi(x) = \exp\left\{-\left[-\log(1 - F(x))\right]^{\theta}\right\}\) and \(\delta = \frac{1}{1 + \theta}\), Proposition H1 provides a characterization of W-R \((\theta, \psi)\) distribution.

3. Infinite Divisibility

Bondesson (1979) showed that all the members of the following families

\[ f(x) = C x^{\alpha-1} (1 + c x^\alpha)^{-\gamma}, \quad x > 0, \quad 0 < \alpha \leq 1, \quad (B_1) \]

\[ f(x) = C x^{\alpha-1} \exp\{-c x^\alpha\}, \quad x > 0, \quad 0 < |\alpha| \leq 1, \quad (B_2) \]

\[ f(x) = C x^{\alpha-1} \exp\left\{-\left(c_1 x + c_2 x^{-1}\right)\right\}, \quad x > 0, -\infty < \beta < \infty, \quad (B_3) \]

\[ f(x) = C x^{-\beta} \exp\left\{-\left(\log x - \mu\right)^2 / (2\sigma^2)\right\}, \quad x > 0, \quad (B_4) \]

where the natural restrictions are put on the unspecified parameters, are infinitely divisible. The last one is the lognormal density.

**Remark 3.1.** Bondesson (1992, Theorem 6.2.4) pointed out that multiplying densities \((B_1) - (B_4)\) by \(C_1 (\delta + x)^{-\gamma}\) for \(\delta > 0\) and \(\nu > 0\), will result in densities which are also infinitely divisible.

**Remark 3.2.** The distributions, listed in Section 1, whose densities can be expressed, in view of Remark 3.1, in the form \((B_1)\) are: BTXII, ZBXII \((\alpha = 1)\), MOEIP \((\alpha = 1)\), LLGW and MB-F \((\alpha + c > 1)\); in the form \((B_2)\) are: EBXII \((\beta = \nu = b = 1, |\alpha| \leq 1)\), McQL \((\alpha = b = 1)\); in the form of \((B_3)\) are: TIGE \(\alpha = 1, \beta = 1, \gamma = 0\), MOEIW \((\theta = \beta = 1, \lambda = 0)\) and TEF \((\alpha = \beta = 1, \lambda = 0)\).

4. Concluding Remarks

In designing a stochastic model for a particular modeling problem, an investigator will be vitally interested to know if their model fits the requirements of a specific underlying probability distribution. To this end, the investigator will vitally depend on the characterizations of the selected distribution. A good number of recently introduced distributions which have important applications in many different fields have been mentioned in this work. Certain characterizations of these distributions have been established. We hope that these results will be of interest to the investigators who may believe their models have distributions mentioned here and are looking for justifying the validity of their models. It is known that determining a distribution is infinitely divisible or not via the existing representations is not easy. We have used Bondesson’s classifications to show that some of the distributions taken up in this work are infinitely divisible. This could be helpful to some researchers. Finally, we like to mention that the distributions mentioned in this work may be a source of preventing duplications of the existing distributions.

Theorem 1. Let \((\Omega, F, P)\) be a given probability space and let \(H = [a, b]\) be an interval for some \(d < b\) \((a = -\infty, b = \infty)\). 

might as well be allowed). Let $X : \Omega \to H$ be a continuous random variable with the distribution function $F$ and let $q_1$ and $q_2$ be two real functions defined on $H$ such that

$$E[q_2(X) \mid X \geq x] = E[q_1(X) \mid X \geq x] \xi(x), \quad x \in H,$$

is defined with some real function $\eta$. Assume that $q_1, q_2 \in C^1(H)$, $\xi \in C^2(H)$ and $F$ is twice continuously differentiable and strictly monotone function on the set $H$. Finally, assume that the equation $\xi q_1 = q_2$ has no real solution in the interior of $H$. Then $F$ is uniquely determined by the functions $q_1, q_2$ and $\xi$, particularly

$$F(x) = \int_a^x C \left| \frac{\xi'(u)}{\xi(u) q_1(u) - q_2(u)} \right| \exp(-s(u)) \, du,$$

where the function $s$ is a solution of the differential equation $s' = \frac{\xi q_1}{\xi q_1 - q_2}$ and $C$ is the normalization constant, such that $\int_H dF = 1$.
