Abstract
In this paper, we consider the multiplicative orders of the MacWilliams matrix of order \( N(M_N)_{ij} \) and the Chebyshev matrix of order \( N(D_N)_{ij} \) according to modulo \( m \) for \( N \geq 1 \). Consequently, we obtained the rules for the orders of the cyclic groups and semigroups generated by reducing the MacWilliams and Chebyshev matrices modulo \( m \) and the determinants of these matrices.

Keywords: MacWilliams matrix, Chebyshev matrix, group, order

2000 Mathematics Subject Classification: 15A15, 20H25, 15A15, 20F05

1. Introduction

The \( r \)th Krawtchouk polynomial of order \( N \), is defined as (See Hirvencalo, 2003; MacWilliams & Sloane, 1977)

\[
K_r^N(x) = \sum_{i=0}^{r} (-1)^i \binom{N-x}{r-i} \binom{x}{i}
\]

where \( K_0^0(0) = 1 \).

The MacWilliams matrix of order \( N \) has been given as (See Gogin & Hirvencalo, 2012; Gogin & Myllari, 2007)

\[
(M_N)_{ij} = K_i^N (j) \quad \text{for} \quad 0 \leq i, j \leq N.
\]

where \( (M_0)_{ij} = 1 \).

The \( r \)th discrete Chebyshev polynomial of order \( N \), is defined as (See Bateman & Erdelyi, 1953; Hirvencalo, 2003)

\[
D_r^N(x) = \sum_{i=0}^{r} (-1)^i \binom{r}{i} \binom{N-x}{r-i} \binom{x}{i}
\]

where \( D_0^0(0) = 1 \).

In Gogin and Hirvencalo (2012), the Chebyshev matrix of order \( N \) has been given as

\[
(D_N)_{ij} = D_i^N (j) \quad \text{for} \quad 0 \leq i, j \leq N.
\]

Note that if \( N = 0 \), \( (D_0)_{ij} = 1 \). It is important to note that \( (M_1)_{ij} = (D_1)_{ij} = \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} \).

Recently, MacWilliams and Chebyshev matrices and their properties have been studied by some authors; see for example (Bateman & Erdelyi, 1953; Gluesing-Luerssen & Schneider, 2008; Gogin & Hirvencalo, 2012, 2007; Gogin & Myllari, 2007; Hirvencalo, 2003; MacWilliams & Sloane, 1977; Pan & Wang, 2012; Szegő, 1975). Lü and Wang (2007) obtained the rules for the orders of the cyclic groups generated by reducing the \( k \)-generalized Fibonacci matrix modulo \( m \). Deveci and Karaduman (2012a) extended the concept to Pascal and generalized Pascal matrices. Now we extend the concept to the MacWilliams matrix of order \( N(M_N)_{ij} \) and the Chebyshev matrix of order \( N(D_N)_{ij} \) for \( N \geq 1 \).

In this paper, the usual notation \( p \) is used for a prime number.

55
2. Method

For given a matrix \( M = [m_{ij}] \) with \( m_{ij} \)‘s being integers, \( M \pmod{m} \) means that each element of \( M \) are reduced modulo \( m \), that is, \( M \pmod{m} = [m_{ij} \pmod{m}] \). Let us consider the set \( \langle M \rangle_m = \{ M' \pmod{m} \mid i \geq 0 \} \). If \( \gcd(m, \det M) = 1 \), then the set \( \langle M \rangle_m \) is a cyclic group; if \( \gcd(m, \det M) \neq 1 \), then the set \( \langle M \rangle_m \) is a semigroup. Let the notation \( |\langle M \rangle_m| \) denotes the order of \( \langle M \rangle_m \).

By matrix algebra it is easy to prove that

\[
\left( (M_N)_{ij} \right)^{2k} = [m_{ij}]_{(N+1) \times (N+1)} = \begin{bmatrix}
2^{2N} & 0 & \cdots & 0 \\
0 & 2^{2N} & \cdots & 0 \\
0 & 0 & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & 2^{2N}
\end{bmatrix}, \quad (k \geq 0)
\]  

(1)

that is, the matrix \( \left( (M_N)_{ij} \right)^{2k} \) is an \((N + 1) \times (N + 1)\) diagonal matrix with \(2^{2N}, \ldots, 2^{2N}\) as diagonal entries.

Also, we obtain \( \det\left( (M_N)_{ij} \right), (N \geq 1) \) as following

\[
\det\left( (M_N)_{ij} \right) = \begin{cases} 
-2^{\frac{N^2N}{2}}, & N \equiv 1, 2 \pmod{4}, \\
2^{\frac{N^2N}{2}}, & N \equiv 0, 3 \pmod{4}.
\end{cases}
\]

(2)

It is easy to see from (2) that \( \langle M_N \rangle_m \) is a cyclic group if \( m \) is an odd integer and \( \langle M_N \rangle_m \) is a semigroup if \( m \) is an even integer.

3. Results

Theorem 3.1 If \( m \) is an odd integer, the order of the cyclic group \( \langle M_N \rangle_m \) is \( 2k \) where \( k \) is least positive integer such that \( 2^{2N} \equiv 1 \pmod{m} \).

Proof. It is easy to see from (1) that \( \left( (M_N)_{ij} \right)^{2k} \pmod{m} \equiv I_{(N+1)} \) where \( I_{(N+1)} \) is identity matrix of size \((N + 1) \times (N + 1)\). If we choose \( k \) as least positive integer such that \( 2^{2N} \equiv 1 \pmod{m} \), then we obtain \( |\langle M_N \rangle_m| = 2k \). \( \square \)

Theorem 3.2 Let \( m \) be an even integer, then two cases occur for order of the semigroup \( \langle M_N \rangle_m \):

(i) If \( m = 2^u (u \in \mathbb{N}) \), then the order of the semigroup \( \langle M_N \rangle_{2^u} \) is \( 2k \) where \( k \) is least positive integer such that \( 2^{2N} \equiv 0 \pmod{m} \).

(ii) If \( m = 2^u t (u \in \mathbb{N}) \) such that \( t \) is an odd integer, then \( |\langle M_N \rangle_{2^u}t| = |\langle M_N \rangle_{2^u}| + |\langle M_N \rangle_t| - 1 \).

Proof. (i) It is easy to see from (1) that

\[
\left( (M_N)_{ij} \right)^{2k} \pmod{m} \equiv 0_{(N+1)},
\]

where \( 0_{(N+1)} \) is zero matrix of size \((N + 1) \times (N + 1)\). If we choose \( k \) as least positive integer such that \( 2^{2N} \equiv 0 \pmod{m} \), then we obtain \( |\langle M_N \rangle_m| = 2k \).

(ii) Let \( |\langle M_N \rangle_t| = 2\alpha \) and \( |\langle M_N \rangle_{2^u}t| = 2\beta \). Then

\[
2^{2N} = k_1 t + 1 \quad \text{and} \quad 2^{2N} = k_2 2^u
\]

where \( k_1, k_2 \in \mathbb{N} \) and \( \gcd(t, k_2) = 1 \). Thus, we have \( 2^{(\alpha + \beta)N} \equiv 2^{\alpha}k_2 \pmod{m} \), that is \( \left( (M_N)_{ij} \right)^{2^{\alpha + \beta}} \pmod{m} \equiv 0 \). So, we get \( |\langle M_N \rangle_{2^u}t| = |\langle M_N \rangle_{2^u}| + |\langle M_N \rangle_t| - 1 \). \( \square \)

Remark 3.1 If \( p \) is the greatest prime factor \( \gcd\left( (D_N)_{ij} \right) \), then \( p \mid \det\left( (D_N)_{ij} \right) \).

Theorem 3.3 Let \( \gcd(p, \det \left( (D_N)_{ij} \right)) = 1 \) and let \( t \) be the largest positive integer such that \( |\langle D_N \rangle_p| = |\langle D_N \rangle_{p^n}| \). Then \( |\langle D_N \rangle_{p^{\alpha t}}| = p^{\alpha - t} |\langle D_N \rangle_{p^n}| \) for every \( \alpha \geq t \). In particular, if \( |\langle D_N \rangle_p| \neq |\langle D_N \rangle_{p^n}| \), then \( |\langle D_N \rangle_{p^t}| = p^{\alpha - 1} |\langle D_N \rangle_{p^n}| \) holds for every \( \alpha > 1 \).
Proof. We first note that \( \langle D_N \rangle_p \) is a cyclic group for every \( u \geq 1 \). Let \( \theta \) be a positive integer and let \( |\langle D_N \rangle_m| \) be denoted by \( h_N(m) \). Since \( \langle D_N \rangle_{ij}^{b_i(p^{\theta+1})} \equiv I_{N+1} \pmod{p^{\theta+1}} \), that is, \( \langle D_N \rangle_{ij}^{b_i(p^{\theta+1})} \equiv I_{N+1} \pmod{p^{\theta}} \), we get that \( h_N(p^\theta) \) divides \( h_N(p^{\theta+1}) \). On the other hand, writing \( \langle D_N \rangle_{ij}^{b_i(p^\theta)} = I_{N+1} + (a_{ij}^{i+1} p^\theta) \), we have
\[
\langle D_N \rangle_{ij}^{b_i(p^\theta)p} = (I_{N+1} + (a_{ij}^{i+1} p^\theta))^p = \sum_{i=0}^p \binom{p}{i} (a_{ij}^{i+1} p^\theta)^i \equiv I_{N+1} \pmod{p^{\theta+1}}.
\]
So we get that \( h_N(p^{\theta+1}) \), \( h_N(p^\theta) \). Thus, \( h_N(p^{\theta+1}) = h_N(p^\theta) \) or \( h_N(p^{\theta+1}) = h_N(p^\theta) \), and the latter holds if, and only if, there is a \( a_{ij}^{i+1} \) such that \( p|a_{ij}^{i+1} \). Since \( h_N(p^\theta) \), there is an \( a_{ij}^{i+1} \) such that \( p|a_{ij}^{i+1} \), therefore, \( h_N(p^{\theta+1}) \) \( h_N(p^\theta) \). The proof is finished by induction on \( t \).

Theorem 3.4 Let \( \gcd(m, \det(\langle D_N \rangle_{ij})) = 1 \) and let \( m = \prod_{i=1}^{t} p_i^{\epsilon_i}, \ (t \geq 1) \) where \( p_i's \) are distinct primes, then \( |\langle D_N \rangle_m| = \text{lcm}[|\langle D_N \rangle_{p_1^{\epsilon_1}}|, |\langle D_N \rangle_{p_2^{\epsilon_2}}|, \ldots, |\langle D_N \rangle_{p_t^{\epsilon_t}}|] \).

Proof. Let \( |\langle D_N \rangle_{p_i^{\epsilon_i}}| = \lambda_i \) for \( 1 \leq k \leq t \) and let \( |\langle D_N \rangle_m| = \lambda \). Then we have the entry \((i, j)\) of
\[
(D_N)_{ij}^{b_i(p^\theta)} = \begin{cases} p_i^{\epsilon_i} e_{ij} K_i^N(j), & i > j, \\ p_i^{\epsilon_i} e_{ij} K_i^N(j) + 1, & i = j, \\ p_i^{\epsilon_i} e_{ij} K_i^N(j), & i < j, \end{cases}
\]
and the entry \((i, j)\) of
\[
(D_N)_{ij} = \begin{cases} m e_{ij} K_i^N(j), & i > j, \\ m e_{ij} K_i^N(j) + 1, & i = j, \\ m e_{ij} K_i^N(j), & i < j, \end{cases}
\]
where \( e_{ij} \) and \( e_{ij}' \) are integers for \( 0 \leq i, j \leq N \).

Therefore \( (D_N)_{ij}^{b_i} \) is of the form \( c \cdot (D_N)_{ij}^{b_i} \), \( c \in \mathbb{N} \) for all values of \( k \), and since any such number gives \( \lambda \), we conclude that \( \lambda = \text{lcm}[\lambda_1, \lambda_2, \ldots, \lambda_t] \).

Corollary 3.1 The orders of the semigroups \( \langle D_2 \rangle_2 \) and \( \langle D_2 \rangle_3 \) are \( 2k + 1 \) and \( 2k \ (k - 1) + 2k + 1 \), respectively.

Proof. We first note that \( \langle D_2 \rangle_2 \) and \( \langle D_2 \rangle_3 \) are semigroups for every \( k \geq 1 \) since \( \det(\langle D_2 \rangle_{ij}) = -12 \). By matrix algebra it is easy to prove that
\[
(D_2)_{ij}^{2k} = \begin{bmatrix} 2^{2k} & 2^{2k-1} (2^{2k} - 3^k) & 0 \\ 0 & 6^k & 0 \\ 2^k (2^{2k} - 3^k) & 2^{2k-1} (2^{2k} - 3^k) & 6^k \end{bmatrix}
\]
and
\[
(D_2)_{ij}^{2k+1} = \begin{bmatrix} 2^k (2^{2k+1} - 3^k) & 2^{2k} & 6^k \\ 2 \cdot 6^k & 0 & -2 \cdot 6^k \\ 2^k (2^{2k+1} - 3^k) & 2^k (2^{2k+1} - 3^k) & 6^k \end{bmatrix}
\]
for \( k \geq 1 \). Since \( (D_2)_{ij}^{2k+1} \equiv 3 \ (mod \ 2^k) \) and \( (D_2)_{ij}^{2k(k-1)+2k+2} \equiv (D_2)_{ij}^{2k} \ (mod \ 3^k) \), we get that \( |\langle D_2 \rangle_2| = 2k + 1 \) and \( |\langle D_2 \rangle_3| = 2^k (k - 1) + 2k + 1 \).

4. Discussion

Wall (1960) proved that the lengths of the periods of the recurring sequences obtained by reducing a Fibonacci sequences by a modulo \( m \) are equal to the lengths of the of ordinary 2-step Fibonacci recurrences in cyclic groups. The theory is expanded to 3-step Fibonacci sequence by Ozkan, Aydin, and Dikici (2003). Liu and Wang (2007) contributed to the study of the Wall number for the \( k \)-step Fibonacci sequence. In (Deveci, 2011; Deveci & Karaduman, 2012b, 2012a, to appear; Dedecci, to appear), the concept has been extended to some special linear recurrence sequences. In this paper, we obtained the cyclic groups and semigroups generated by reducing the MacWilliams
and Chebyshev matrices modulo $m$. Are there groups such that the lengths of the periods of some special recurrence sequences of elements of these groups are obtained by the orders of these cyclic groups and semigroups?
